0.1. De winnende aanpak.

- Goed slapen & een vroeg ritme hebben
- Genoeg drinken & eten voor en tijdens de wedstrijd
- Een lijst van alle problemen met info waar het over gaat, en wie het goed kan oplossen
- Ludo moet **ALLE** opgaves goed lezen
- Test de kleine voorbeeldgevallen
- Houd na 2 uur een pauze en overleg waar iedereen mee bezig is
- Maak zelf wat test-cases
- Typ de dingen uit de TCR, die je zeker nodig hebt, alvast in
- Als iemand niks te doen heeft, kan hij nodige dingen uit de TCR typen.
- We moeten ook een voorbeeld test-case voor TCR algoritmes hebben om te testen of het goed overgetypt is
- Bij geometrie moeten we om kunnen gaan met meerdere input manieren (voor bv. lijnen)
- Gebruik veel long long's

0.2. Wrong Answer.

- (1) Print de oplossing om te debuggen! Kijk ook naar andere (mogelijk makkelijkere) problemen.

(2) Bedenk zelf test-cases met randgevallen!

(3) Controleer op overflow (gebruik OVERAL long long, long double).

(4) Kijk naar overflows in tussenantwoorden bij modulo.

(5) Controleer de precisie.

(6) Controleer op typo's.

(7) Loop de voorbeeldinput accuraat langs.

(7) Controllor op off-by-one-errors (in indices of lus-grenzen)?

0.3. Detecting overflow. These are GNU builtins, detect both overflow and underflow. Returns a boolean upon failure, otherwise the result is present in ref. Follow the template:

```
1|bool isOverflown = __builtin_[add|mul|sub]_overflow(a, b, &res);
```

0.4. Covering problems.

- Minimum edge cover \iff Maximum independent set

Matching: A set of edges without common vertices (*Maximum is the largest such set, maximal is a set which you cannot add more edges to without breaking the property*).

Minimum Vertex Cover: A set vertices (cover) such that each edge in the graph is incident to at least one vertex of the set.

Minimum Edge Cover: A set of edges (cover) such that every vertex is incident to at least one edge of the set.

Maximum Independent Set: A set of vertices in a graph such that no two of them are adjacent.

König's theorem: In any bipartite graph, the number of edges in a maximum matching equals the number of vertices in a minimum vertex cover

0.5. Game theory. A game can be reduced to Nim if it is a finite impartial game. Nim and its variants include:

- Nim:** Let $X = \bigoplus_{i=1}^n x_i$, then $(x_i)_{i=1}^n$ is a winning position iff $X \neq \emptyset$. Find a move by picking k such that $x_k > x_k \oplus X$.

Misère Nim: Regular Nim, except that the last player to move *loses*. Play regular Nim until there is only one pile of size larger than 1, reduce it to 0 or 1 such that there is an odd number of piles.

Staricase Nim: Stones are moved down a staircase and only removed from the last pile. $(x_i)_{i=1}^n$ is an L -position if $(x_{2i-1})_{i=1}^{n/2}$ is (is not) only look at odd-numbered piles).

Moore's Nim $_k$: The player may remove from at most k piles (Nim \leq Nim $_1$). Expand the piles in base 2, do a carry-less addition in base $k + 1$ (i.e. the number of ones in each column should be divisible by $k + 1$).

Dim $^+$: The number of removed stones must be a divisor of the pile size. The Sprague-Grundy function is $k + 1$ where 2^k is the largest power of 2 dividing the pile size.

Aliquot game: Same as above, except the divisor should be proper (hence 1 is also a terminal state, but watch out for size 0 piles). Now the Sprague-Grundy function is just k .

Nim (at most half): Write $n + 1 = 2^m y$ with m maximal, then the Sprague-Grundy function of n is $(y - 1)/2$.

Lasker's Nim: Players may alternatively split a pile into two new non-empty piles. $g(4k + 1) = 4k + 1$, $g(4k + 2) = 4k + 2$, $g(4k + 3) = 4k + 4$, $g(4k + 4) = 4k + 3$ ($k \geq 0$).

```
Hackenbush on trees: A tree with stalks  $(x_i)_{i=1}^n$  may be replaced with a single stalk with length  $\bigoplus_{i=1}^n x_i$ .
A useful identity:  $\bigoplus_{x=0}^{a-1} x = \{0, a - 1, 1, a\}[a \bmod 4]$ .

// vim: cc=60 ts=2 sts=2 sw=2:
```

```
1.4. Fast Hadamard Transform. Computes the Hadamard transform
of the given array. Can be used to compute the XOR-convolution of arrays,
exactly like with FFT. For AND-convolution, use  $(x+y, y)$  and  $(x-y, y)$ .
For OR-convolution, use  $(x, x+y)$  and  $(x, -x+y)$ . Note: Size of array
must be a power of 2.

void fht(vi &arr, bool inv=false, int l=0, int r=-1) {
    if (r == -1) { fht(arr,inv,0,size(arr)); return; }
    if (l+1 == r) return;

1.10. Numbers and Sequences. Some random prime numbers: 1031, 32771, 1048583, 33554467, 1073741827, 34359738421, 1099511627791, 35184372088891, 1125899906842679, 36028797018963971. More random prime numbers: $10^3 + \{-9, -3, 9, 13\}$, $10^6 + \{-17, 3, 33\}$, $10^9 + \{7, 9, 21, 33, 87\}$.

	840	32
	720 720	240
Some maximal divisor counts:	735 134 400	1 344
	963 761 198 400	6 720
	866 421 317 361 600	26 880
	897 612 484 786 617 600	103 680

2. DATASTRUCTURES

```
2.1. Standard segment tree  $\mathcal{O}(\log n)$ .

typedef /* Tree element */ S;
const int n = 1 << 20; S t[2 * n];

// required axiom: associativity
S combine(S l, S r) { return l + r; } // sum segment tree
S combine(S l, S r) { return max(l, r); } // max segment tree

void build() { for (int i = n; --i; ) t[i] = combine(t[2 * i],
    t[2 * i + 1]); }

// set value v on position i
```

```
void update(int i, S v) { for (t[i += n] = v; i /= 2; ) t[i] ← combine(t[2 * i], t[2 * i + 1]); }

// sum on interval [l, r)
S query(int l, int r) {
    S resL, resR;
    for (l += n, r += n; l < r; l /= 2, r /= 2) {
        if (l & 1) resL = combine(resL, t[l++]);
        if (r & 1) resR = combine(t[--r], resR);
    }
    return combine(resL, resR);
}
```

2.2. Binary Indexed Tree $\mathcal{O}(\log n)$. Use one-based indices ($i > 0$)!

```
int bit[MAXN + 1];

// arr[i] += v
void update(int i, int v) {
    while (i <= MAXN) bit[i] += v, i += i & -i;
}

// returns sum of arr[i], where i: [1, i]
int query(int i) {
    int v = 0; while (i) v += bit[i], i -= i & -i; return v;
}
```

2.3. Disjoint-Set / Union-Find $\mathcal{O}(\alpha(n))$.

```
int par[MAXN], rnk[MAXN];

void uf_init(int n) {
    fill_n(par, n, -1); fill_n(rnk, n, 0);
}

int uf_find(int v) { return par[v] < 0 ? v : par[v] = uf_find(par[v]); }

void uf_union(int a, int b) {
    if ((a = uf_find(a)) == (b = uf_find(b))) return;
    if (rnk[a] < rnk[b]) swap(a, b);
    if (rnk[a] == rnk[b]) rnk[a]++;
    par[b] = a;
}
```

3. GRAPH ALGORITHMS

3.1. Maximum matching $\mathcal{O}(nm)$. This problem could be solved with a flow algorithm like Dinic's algorithm which runs in $\mathcal{O}(\sqrt{V}E)$, too.

```
const int sizeL = 1e4, sizeR = 1e4;

bool vis[sizeR];
int par[sizeR]; // par : R -> L
vi adj[sizeL]; // adj : L -> (N -> R)

bool match(int u) {
    for (int v : adj[u]) {
        if (vis[v]) continue; vis[v] = true;
        if (par[v] == -1 || match(par[v])) {
            par[v] = u;
            return true;
        }
    }
    return false;
}

// perfect matching iff ret == sizeL == sizeR
int maxmatch() {
    fill_n(par, sizeR, -1); int ret = 0;
    for (int i = 0; i < sizeL; i++) {
        fill_n(vis, sizeR, false);
        ret += match(i);
    }
    return ret;
}
```

3.2. Strongly Connected Components $\mathcal{O}(V + E)$.

```
1 vvi adj, comps; vi tidx, lnk, cnr, st; vector<bool> vis; int
  ↪ age, ncomps;
2
3 void tarjan(int v) {
4     tidx[v] = lnk[v] = ++age; vis[v] = true; st.pb(v);
5
6     for (int w : adj[v]) {
7         if (!tidx[w]) tarjan(w), lnk[v] = min(lnk[v], lnk[w]);
8         else if (vis[w]) lnk[v] = min(lnk[v], tidx[w]);
9     }
10
11     if (lnk[v] != tidx[v]) return;
12
13     comps.pb(vi()); int w;
14     do {
15         vis[w = st.back()] = false; cnr[w] = ncomps;
16         ↪ comps.back().pb(w);
17         st.pop_back();
18     } while (w != v);
19     ncomps++;
20 }
21
22 void findSCC(int n) {
23     age = ncomps = 0; vis.assign(n, false); tidx.assign(n, 0);
24     ↪ lnk.resize(n);
25     cnr.resize(n); comps.clear();
26
27     for (int i = 0; i < n; i++)
28         if (tidx[i] == 0) tarjan(i);
29 }
```

3.2.1. 2-SAT $\mathcal{O}(V + E)$. Include findSCC.

```
1 void init2sat(int n) { adj.assign(2 * n, vi()); }
2
3 // vl, vr = true -> variable l, variable r should be negated.
4 void imply(int xl, bool vl, int xr, bool vr) {
```

```
5     adj[2 * xl + vl].pb(2 * xr + vr); adj[2 * xr + !vr].pb(2 * xl
  ↪ + !vl); }
6
7 void satOr(int xl, bool vl, int xr, bool vr) { imply(xl, !vl,
  ↪ xr, vr); }
8 void satConst(int x, bool v) { imply(x, !v, x, v); }
9 void satIff(int xl, bool vl, int xr, bool vr) {
10     imply(xl, vl, xr, vr); imply(xr, vr, xl, vl); }
11
12 bool solve2sat(int n, vector<bool> &sol) {
13     findSCC(2 * n);
14     for (int i = 0; i < n; i++)
15         if (cnr[2 * i] == cnr[2 * i + 1]) return false;
16     vector<bool> seen(n, false); sol.assign(n, false);
17     for (vi &comp : comps) {
18         for (int v : comp) {
19             if (seen[v / 2]) continue;
20             seen[v / 2] = true; sol[v / 2] = v & 1;
21         }
22     }
23     return true;
24 }
```

3.3. Cycle Detection $\mathcal{O}(V + E)$.

```
1 vvi adj; // assumes bidirected graph, adjust accordingly
2
3 bool cycle_detection() {
4     stack<int> s; vector<bool> vis(MAXN, false); vi par(MAXN,
  ↪ -1); s.push(0);
5     vis[0] = true;
6     while(!s.empty()) {
7         int cur = s.top(); s.pop();
8         for(int i : adj[cur]) {
9             if(vis[i] && par[cur] != i) return true;
10             s.push(i); par[i] = cur; vis[i] = true;
11         }
12     }
13     return false; }
```

3.4. Shortest path.

3.4.1. Dijkstra $\mathcal{O}(E + V \log V)$.

3.4.2. Floyd-Warshall $\mathcal{O}(V^3)$.

```
1 int n = 100; ll d[MAXN][MAXN];
2 for (int i = 0; i < n; i++) fill_n(d[i], n, 1e18);
3 // set direct distances from i to j in d[i][j] (and d[j][i])
4 for (int i = 0; i < n; i++)
5     for (int j = 0; j < n; j++)
6         for (int k = 0; k < n; k++)
7             d[j][k] = min(d[j][k], d[j][i] + d[i][k]);
```

```
3.4.3. Bellman Ford  $\mathcal{O}(VE)$ . This is only useful if there are edges with
weight  $w_{ij} < 0$  in the graph.
vector< pair<pii, ll> > edges; // ((from, to), weight)
vector<ll> dist;

// when undirected, add back edges
bool bellman_ford(int V, int source) {
    dist.assign(V, 1e18); dist[source] = 0;

    bool updated = true; int loops = 0;
    while (updated && loops < n) {
        updated = false;
        for (auto e : edges) {
            int alt = dist[e.x.x] + e.y;
            if (alt < dist[e.x.y]) {
                dist[e.x.y] = alt; updated = true;
            }
        }
        return loops < n; // loops >= n: negative cycles
    }
}

3.5. Max-flow min-cut.

3.5.1. Dinic's Algorithm  $\mathcal{O}(V^2E)$ .
struct edge {
    int to, rev; ll cap, flow;
    edge(int t, int r, ll c) : to(t), rev(r), cap(c), flow(0) {}
};

int s, t, level[MAXN]; // s = source, t = sink
vector<edge> g[MAXN];

void add_edge(int fr, int to, ll cap) {
    g[fr].pb(edge(to, g[to].size(), cap)); g[to].pb(edge(fr,
    ↪ g[fr].size() - 1, 0));
}

bool dinic_bfs() {
    fill_n(level, MAXN, 0); level[s] = 1;

    queue<int> q; q.push(s);
    while (!q.empty()) {
        int cur = q.front(); q.pop();
        for (edge e : g[cur]) {
            if (level[e.to] == 0 && e.flow < e.cap) {
                level[e.to] = level[cur] + 1; q.push(e.to);
            }
        }
    }
    return level[t] != 0;
}

ll dinic_dfs(int cur, ll maxf) {
    if (cur == t) return maxf;

    ll f = 0; bool isSat = true;
```

```
    for (edge &e : g[cur]) {

// vim: cc=60 ts=2 sts=2 sw=2:
```

5.8. **Formulas.** Let $a = (a_x, a_y)$ and $b = (b_x, b_y)$ be two-dimensional vectors.

- $a \cdot b = |a||b| \cos \theta$, where θ is the angle between a and b .
- $a \times b = |a||b| \sin \theta$, where θ is the signed angle between a and b .
- $a \times b$ is equal to the area of the parallelogram with two of its sides formed by a and b . Half of that is the area of the triangle formed by a and b .
- **Euler's formula:** $V - E + F = 2$
- Side lengths a, b, c can form a triangle iff. $a + b > c$, $b + c > a$ and $a + c > b$.
- Sum of internal angles of a regular convex n -gon is $(n - 2)\pi$.
- **Law of sines:** $\frac{a}{\sin A} = \frac{b}{\sin B} = \frac{c}{\sin C}$
- **Law of cosines:** $b^2 = a^2 + c^2 - 2ac \cos B$
- Internal tangents of circles $(c_1, r_1), (c_2, r_2)$ intersect at $(c_1 r_2 + c_2 r_1) / (r_1 + r_2)$, external intersect at $(c_1 r_2 - c_2 r_1) / (r_1 + r_2)$.

6. MISCELLANEOUS

6.1. **Binary search** $\mathcal{O}(\log(hi - lo))$.

```

			• Look at the complement problem

- Minimize something instead of maximizing
- Immediately enforce necessary conditions. (All values greater than 0? Initialize them all to 1)
- Add large constant to negative numbers to make them positive
- Counting/Bucket sort

11. FORMULAS

- **Legendre symbol:** $\left(\frac{a}{b}\right) = a^{(b-1)/2} \pmod{b}$, b odd prime.
- **Heron’s formula:** A triangle with side lengths a, b, c has area $\sqrt{s(s-a)(s-b)(s-c)}$ where $s = \frac{a+b+c}{2}$.
- **Pick’s theorem:** A polygon on an integer grid strictly containing i lattice points and having b lattice points on the boundary has area $i + \frac{b}{2} - 1$. (Nothing similar in higher dimensions)
- **Euler’s totient:** The number of integers less than n that are coprime to n are $n \prod_{p|n} \left(1 - \frac{1}{p}\right)$ where each p is a distinct prime factor of n .
- **König’s theorem:** In any bipartite graph $G = (L \cup R, E)$, the number of edges in a maximum matching is equal to the number of vertices in a minimum vertex cover. Let U be the set of unmatched vertices in L , and Z be the set of vertices that are either in U or are connected to U by an alternating path. Then $K = (L \setminus Z) \cup (R \cap Z)$ is the minimum vertex cover.
- A minumum Steiner tree for n vertices requires at most $n-2$ additional Steiner vertices.
- The number of vertices of a graph is equal to its minimum vertex cover number plus the size of a maximum independent set.
- **Lagrange polynomial** through points $(x_0, y_0), \dots, (x_k, y_k)$ is $L(x) = \sum_{j=0}^k y_j \prod_{\substack{0 \leq m \leq k \\ m \neq j}} \frac{x-x_m}{x_j-x_m}$
- **Hook length formula:** If λ is a Young diagram and $h_\lambda(i, j)$ is the hook-length of cell (i, j) , then then the number of Young tableaux $d_\lambda = n! / \prod h_\lambda(i, j)$.
- **Möbius inversion formula:** If $f(n) = \sum_{d|n} g(d)$, then $g(n) = \sum_{d|n} \mu(d) f(n/d)$. If $f(n) = \sum_{m=1}^n g(\lfloor n/m \rfloor)$, then $g(n) = \sum_{m=1}^n \mu(m) f(\lfloor \frac{n}{m} \rfloor)$.
- #primitive pythagorean triples with hypotenuse $< n$ approx $n/(2\pi)$.
- **Frobenius Number:** largest number which can’t be expressed as a linear combination of numbers a_1, \dots, a_n with non-negative coefficients. $g(a_1, a_2) = a_1 a_2 - a_1 - a_2$, $N(a_1, a_2) = (a_1 - 1)(a_2 - 1)/2$. $g(d \cdot a_1, d \cdot a_2, a_3) = d \cdot g(a_1, a_2, a_3) + a_3(d - 1)$. An integer $x > (\max_i a_i)^2$ can be expressed in such a way iff. $x \mid \gcd(a_1, \dots, a_n)$.

11.1. Physics.

- **Snell’s law:** $\frac{\sin \theta_1}{v_1} = \frac{\sin \theta_2}{v_2}$

11.2. **Markov Chains.** A Markov Chain can be represented as a weighted directed graph of states, where the weight of an edge represents the probability of transitioning over that edge in one timestep. Let $P^{(m)} = (p_{ij}^{(m)})$ be the probability matrix of transitioning from state i to state j in m timesteps, and note that $P^{(1)}$ is the adjacency matrix of the graph. **Chapman-Kolmogorov:** $p_{ij}^{(m+n)} = \sum_k p_{ik}^{(m)} p_{kj}^{(n)}$. It follows that $P^{(m+n)} = P^{(m)} P^{(n)}$ and $P^{(m)} = P^m$. If $p^{(0)}$ is the initial probability distribution (a vector), then $p^{(0)} P^{(m)}$ is the probability distribution after m timesteps.

The return times of a state i is $R_i = \{m \mid p_{ii}^{(m)} > 0\}$, and i is *aperiodic* if $\gcd(R_i) = 1$. A MC is aperiodic if any of its vertices is aperiodic. A MC is *irreducible* if the corresponding graph is strongly connected.

A distribution π is stationary if $\pi P = \pi$. If MC is irreducible then $\pi_i = 1/\mathbb{E}[T_i]$, where T_i is the expected time between two visits at i . π_j/π_i is the expected number of visits at j in between two consecutive visits at i . A MC is *ergodic* if $\lim_{m \rightarrow \infty} p^{(0)} P^m = \pi$. A MC is ergodic iff. it is irreducible and aperiodic.

A MC for a random walk in an undirected weighted graph (unweighted graph can be made weighted by adding 1-weights) has $p_{uv} = w_{uv} / \sum_x w_{ux}$. If the graph is connected, then $\pi_u = \sum_x w_{ux} / \sum_v \sum_x w_{vx}$. Such a random walk is aperiodic iff. the graph is not bipartite.

An *absorbing* MC is of the form $P = \begin{pmatrix} Q & R \\ 0 & I_r \end{pmatrix}$. Let $N = \sum_{m=0}^\infty Q^m = (I_t - Q)^{-1}$. Then, if starting in state i , the expected number of steps till absorption is the i -th entry in $N1$. If starting in state i , the probability of being absorbed in state j is the (i, j) -th entry of NR .

Many problems on MC can be formulated in terms of a system of recurrence relations, and then solved using Gaussian elimination.

11.3. **Burnside’s Lemma.** Let G be a finite group that acts on a set X . For each g in G let X^g denote the set of elements in X that are fixed by g . Then the number of orbits

$$|X/G| = \frac{1}{|G|} \sum_{g \in G} |X^g|$$

$$Z(S_n) = \frac{1}{n} \sum_{l=1}^n a_l Z(S_{n-l})$$

11.4. **Bézout’s identity.** If (x, y) is any solution to $ax + by = d$ (e.g. found by the Extended Euclidean Algorithm), then all solutions are given by

$$\left(x + k \frac{b}{\gcd(a, b)}, y - k \frac{a}{\gcd(a, b)}\right)$$

11.5. Misc.

11.5.1. *Determinants and PM.*

$$\det(A) = \sum_{\sigma \in S_n} \text{sgn}(\sigma) \prod_{i=1}^n a_{i, \sigma(i)}$$

$$\text{perm}(A) = \sum_{\sigma \in S_n} \prod_{i=1}^n a_{i, \sigma(i)}$$

$$\begin{aligned} pf(A) &= \frac{1}{2^n n!} \sum_{\sigma \in S_{2n}} \text{sgn}(\sigma) \prod_{i=1}^n a_{\sigma(2i-1), \sigma(2i)} \\ &= \sum_{M \in \text{PM}(n)} \text{sgn}(M) \prod_{(i,j) \in M} a_{i,j} \end{aligned}$$

11.5.2. *BEST Theorem.* Count directed Eulerian cycles. Number of OST given by Kirchoff’s Theorem (remove r/c with root) $\# \text{OST}(G, r) \cdot \prod_v (d_v - 1)!$

11.5.3. *Primitive Roots.* Only exists when n is $2, 4, p^k, 2p^k$, where p odd prime. Assume n prime. Number of primitive roots $\phi(\phi(n))$ Let g be primitive root. All primitive roots are of the form g^k where $k, \phi(p)$ are coprime.

k -roots: $g^{i \cdot \phi(n)/k}$ for $0 \leq i < k$

11.5.4. *Sum of primes.* For any multiplicative f :

$$S(n, p) = S(n, p-1) - f(p) \cdot (S(n/p, p-1) - S(p-1, p-1))$$

11.5.5. *Floor.*

$$\lfloor \lfloor x/y \rfloor / z \rfloor = \lfloor x/(yz) \rfloor$$

$$x \% y = x - y \lfloor x/y \rfloor$$

PRACTICE CONTEST CHECKLIST

- How many operations per second? Compare to local machine.
- What is the stack size?
- How to use printf/scanf with long long/long double?
- Are `__int128` and `__float128` available?
- Does MLE give RTE or MLE as a verdict? What about stack overflow?
- What is `RAND_MAX`?
- How does the judge handle extra spaces (or missing newlines) in the output?
- Look at documentation for programming languages.
- Try different programming languages: C++, Java and Python.
- Try the submit script.
- Try local programs: `i?python[23]`, `factor`.
- Try submitting with `assert(false)` and `assert(true)`.
- Return-value from `main`.
- Look for directory with sample test cases.
- Make sure printing works.
- Remove this page from the notebook.
