git diff solution (Jens Heuseveldt, Ludo Pulles, Pim Spelier)

Contents

At the start of a contest, create the following files in the home-dir:

.vimrc:

```
set nu sw=4 ts=4 sts=4 noet ai hls shcf=-ic
sy on | colo slate
```

.bashrc:

```
alias gsubmit='g++ -Wall -Wshadow -std=c++14'
alias g11='gsubmit -DLOCAL -g'
gsettings set
↪  org.compiz.core:/org/compiz/profiles/unity/plugins/core/
↪  vsize 3
gsettings set
↪  org.compiz.core:/org/compiz/profiles/unity/plugins/core/
↪  hsize 3
```

Test script (usage: ./test.sh A/B/..)

```
g++ $1.cpp
for i in $1/*.in
do
  j="${i/.in/.ans}"
  ./a.out < $i > output
  diff output $j || echo "WA on $i"
done
```

template.cpp

```
#include<bits/extc++.h>
using namespace std;
using namespace __gnu_pbds;

// BBST + order statistics (if supported by judge)
// iterator find_by_order(int r) (zero based)
// int order_of_key(TK v)
template<class TK, class TM> using order_tree = tree<TK, TM,
↪  less<TK>, rb_tree_tag,
↪  tree_order_statistics_node_update>;
template<class TV> using order_set = order_tree<TV,
↪  null_type>;

typedef long long ll;
typedef long double ld;
typedef pair<int, int> ii;
typedef vector<int> vi;
typedef vector<vi> vvi;
typedef vector<ii> vii;

#define x first
#define y second
#define pb push_back
#define eb emplace_back
#define rep(i,a,b) for(auto i=(a);i!=(b); ++i)
#define REP(i,n) rep(i,0,n)

↪  << endl

template<class T> using min_queue = priority_queue<T,
↪  vector<T>, greater<T>>;
template<class T> int size(const T &x) { return x.size(); }
↪  // copy the ampersand(&)!
```

```cpp
const int INF = 2147483647;
const ll LLINF = ~(1LL<<63); // = 9.223.372.036.854.775.807
const ld PI = acos(-1.0);

void run() {

}

signed main() {
  ios_base::sync_with_stdio(false);
  cin.tie(NULL);
  (cout << fixed).precision(18);
  run();
  return 0;
}
```

0.1. De winnende aanpak.

- Slaap goed & heb een vroeg ritme!
- Drink & eet genoeg voor & tijdens de wedstrijd!
- Houd een lijst bij met info over alle problemen.
- Ludo moet **ALLE** opgaves **goed** lezen!
- Analyseer de voorbeeld test cases.
- Houd na 2 uur een pauze en overleg waar iedereen mee bezig is.
- Maak zelf (zware) test cases.
- Gebruik `ll` indien wellicht nodig.

0.2. Wrong Answer.

(1) Print de oplossing om te debuggen!
(2) Kijk naar wellicht makkelijkere problemen.
(3) Bedenk zelf test cases met **randgevallen**!
(4) Controleer de **precisie**.
(5) Controleer op **overflow** (gebruik **OVERAL** `ll`, `ld`).
Kijk naar overflows in tussenantwoorden bij modulo.
(6) Controleer op **typo's**.
(7) Loop de voorbeeld test case accuraat langs.
(8) Controleer op off-by-one-errors (in indices of lus-grenzen)?

Detecting overflow This GNU builtin checks for over- and underflow. Result is in `res` if successful:

```cpp
bool isOverflown = __builtin_[add|mul|sub]_overflow(a, b, &res);
```

0.3. Covering problems.

Minimum edge cover $\iff$ *Maximum independent set*

Matching: A set of edges without common vertices *(Maximum is the **largest** such set, maximal is a set which you cannot add more edges to without breaking the property).*

Minimum Vertex Cover: A set vertices (cover) such that each edge in the graph is incident to at least one vertex of the set.

Minimum Edge Cover: A set of edges (cover) such that every vertex is incident to at least one edge of the set.

Maximum Independent Set: A set of vertices in a graph such that no two of them are adjacent.

König's theorem: In any bipartite graph, the number of edges in a maximum matching equals the number of vertices in a minimum vertex cover

0.4. Game theory.

A game can be reduced to Nim if it is a finite impartial game. Nim and its variants include:

Nim: Let $X = \bigoplus_{i=1}^n x_i$, then $(x_i)_{i=1}^n$ is a winning position iff $X \neq 0$. Find a move by picking k such that $x_k > x_k \oplus X$.

Misère Nim: Regular Nim, except that the last player to move *loses*. Play regular Nim until there is only one pile of size larger than 1, reduce it to 0 or 1 such that there is an odd number of piles.

Staircase Nim: Stones are moved down a staircase and only removed from the last pile. $(x_i)_{i=1}^n$ is an L-position if $(x_{2i-1})_{i=1}^{n/2}$ is (i.e. only look at odd-numbered piles).

Moore's Nim$_k$: The player may remove from at most k piles (Nim = Nim$_1$). Expand the piles in base 2, do a carry-less addition in base $k+1$ (i.e. the number of ones in each column should be divisible by $k+1$).

Dim$^+$: The number of removed stones must be a divisor of the pile size. The Sprague-Grundy function is $k+1$ where 2^k is the largest power of 2 dividing the pile size.

Aliquot game: Same as above, except the divisor should be proper (hence 1 is also a terminal state, but watch out for size 0 piles). Now the Sprague-Grundy function is just k.

Nim (at most half): Write $n+1 = 2^m y$ with m maximal, then the Sprague-Grundy function of n is $(y-1)/2$.

Lasker's Nim: Players may alternatively split a pile into two new non-empty piles. $g(4k+1) = 4k+1$, $g(4k+2) = 4k+2$, $g(4k+3) = 4k+4$, $g(4k+4) = 4k+3$ ($k \geq 0$).

Hackenbush on trees: A tree with stalks $(x_i)_{i=1}^n$ may be replaced with a single stalk with length $\bigoplus_{i=1}^n x_i$.

A useful identity: $\bigoplus_{x=0}^{a-1} x = \{0, a-1, 1, a\}[a \bmod 4]$.

1. Math

```cpp
int abs(int x) { return x > 0 ? x : -x; }
int sign(int x) { return (x > 0) - (x < 0); }

// greatest common divisor
ll gcd(ll a, ll b) { while (b) a %= b, swap(a, b); return a; }
// least common multiple
ll lcm(ll a, ll b) { return a / gcd(a, b) * b; }
ll mod(ll a, ll b) { return (a %= b) < 0 ? a + b : a; }

// safe multiplication (ab % m) for m <= 4e18 in O(log b)
ll mod_mul(ll a, ll b, ll m) {
  ll r = 0;
  while (b) {
    if (b & 1) r = (r + a) % m; a = (a + a) % m; b >>= 1;
  }
  return r;
}

// safe exponentation (a^b % m) for m <= 2e9 in O(log b)
ll mod_pow(ll a, ll b, ll m) {
  ll r = 1;
  while (b) {
    if (b & 1) r = (r * a) % m; // r = mod_mul(r, a, m);
    a = (a * a) % m; // a = mod_mul(a, a, m);
    b >>= 1;
  }
  return r;
}

// returns x, y such that ax + by = gcd(a, b)
ll egcd(ll a, ll b, ll &x, ll &y) {
  ll xx = y = 0, yy = x = 1;
  while (b) {
    x -= a / b * xx; swap(x, xx);
    y -= a / b * yy; swap(y, yy);
    a %= b; swap(a, b);
  }
  return a;
}

// Chinese remainder theorem: returns (u, v) s.t.: x = u (mod v) <=> x = a (mod n) and x = b (mod m) for n,m <= 1e9
pair<ll, ll> crt(ll a, ll n, ll b, ll m) {
  ll s, t, d = egcd(n, m, s, t);
  if (mod(a - b, d)) return { 0, -1 };
  return { mod(s*b%m*n + t*a%n*m, n*m)/d, n*m/d };
}

// phi[i] = #{ 0 < j <= i | gcd(i, j) = 1 }
vi totient(int N) {
  vi phi(N);
  for (int i = 0; i < N; i++) phi[i] = i;
  for (int i = 2; i < N; i++)
    if (phi[i] == i)
      for (int j = i; j < N; j += i) phi[j] -= phi[j] / i;
  return phi;
}

// calculate nCk % p (p prime!)
ll lucas(ll n, ll k, ll p) {
  ll ans = 1;
  while (n) {
    ll np = n % p, kp = k % p;
    if (np < kp) return 0;
    ans = mod(ans * binom(np, kp), p); // (np C kp)
    n /= p; k /= p;
  }
  return ans;
}

// returns if n is prime for n < 3e24 ( > 2^64)
// but use mul_mod for n > 2e9!!!
bool millerRabin(ll n){
  if (n < 2 || n % 2 == 0) return n == 2;
  ll d = n - 1, ad, s = 0, r;
  for (; d % 2 == 0; d /= 2) s++;
  for (int a : { 2, 3, 5, 7, 11, 13, 17, 19, 23, 29, 31, 37, 41 }) {
    if (n == a) return true;
    if ((ad = mod_pow(a, d, n)) == 1) continue;
    for (r = 0; r < s && ad + 1 != n; r++)
      ad = (ad * ad) % n;
```

```
    if (r == s) return false;
  }
  return true;
}
```

1.1. Primitive Root.

```
ll primitive_root(ll m) {
  vector<ll> div;
  for (ll i = 1; i*i < m; i++) {
    if ((m-1) % i == 0) {
      if (i < m) div.pb(i);
      if (m/i < m) div.pb(m/i); } }
  rep(x,2,m) {
    bool ok = true;
    for (ll d : div)
      if (mod_pow(x, d, m) == 1) {
        ok = false; break; }
    if (ok) return x; }
  return -1; }
```

1.2. Tonelli-Shanks algorithm.

Given prime p and integer $1 \le n < p$, returns the square root r of n modulo p. There is also another solution given by $-r$ modulo p.

```
ll legendre(ll a, ll p) {
  if (a % p == 0) return 0;
  if (p == 2) return 1;
  return mod_pow(a, (p-1)/2, p) == 1 ? 1 : -1; }
ll tonelli_shanks(ll n, ll p) {
  assert(legendre(n,p) == 1);
  if (p == 2) return 1;
  ll s = 0, q = p-1, z = 2;
  while (~q & 1) s++, q >>= 1;
  if (s == 1) return mod_pow(n, (p+1)/4, p);
  while (legendre(z,p) != -1) z++;
  ll c = mod_pow(z, q, p),
     r = mod_pow(n, (q+1)/2, p),
     t = mod_pow(n, q, p),
     m = s;
  while (t != 1) {
    ll i = 1, ts = (ll)t*t % p;
    while (ts != 1) i++, ts = ((ll)ts * ts) % p;
    ll b = mod_pow(c, 1LL<<(m-i-1), p);
    r = (ll)r * b % p;
    t = (ll)t * b % p * b % p;
    c = (ll)b * b % p;
    m = i; }
  return r; }
```

1.3. Numeric Integration.

Numeric integration using Simpson's rule.

```
ld numint(ld (*f)(ld), ld a, ld b, ld EPS = 1e-6) {
  ld ba = b - a, m=(a+b)/2;
  return abs(ba) < EPS ?
  ↪  ba/8*(f(a)+f(b)+f(a+ba/3)*3+f(b-ba/3)*3)
    : numint(f,a,m,EPS) + numint(f,m,b,EPS);
}
```

1.4. Fast Hadamard Transform.

Computes the Hadamard transform of the given array. Can be used to compute the XOR-convolution of arrays, exactly like with FFT. For AND-convolution, use $(x+y, y)$ and $(x-y, y)$. For OR-convolution, use $(x, x+y)$ and $(x, -x+y)$. **Note**: Size of array must be a power of 2.

```
void fht(vi &arr, bool inv=false, int l, int r) {
  if (l+1 == r) return;
  int k = (r-l)/2;
  if (!inv) fht(arr, inv, l, l+k), fht(arr, inv, l+k, r);
  rep(i,l,l+k) { int x = arr[i], y = arr[i+k];
    if (!inv) arr[i] = x-y, arr[i+k] = x+y;
    else arr[i] = (x+y)/2, arr[i+k] = (-x+y)/2; }
  if (inv) fht(arr, inv, l, l+k), fht(arr, inv, l+k, r); }
```

1.5. Tridiagonal Matrix Algorithm.

Solves a tridiagonal system of linear equations $a_i x_{i-1} + b_i x_i + c_i x_{i+1} = d_i$ where $a_1 = c_n = 0$. Beware of numerical instability.

```
#define MAXN 5000
ld A[MAXN], B[MAXN], C[MAXN], D[MAXN], X[MAXN];
void solve(int n) {
  C[0] /= B[0]; D[0] /= B[0];
  rep(i,1,n-1) C[i] /= B[i] - A[i]*C[i-1];
  rep(i,1,n) D[i] = (D[i] - A[i]*D[i-1]) / (B[i] -
  ↪  A[i]*C[i-1]);
  X[n-1] = D[n-1];
  for (int i = n-1; i--;)
    X[i] = D[i] - C[i] * X[i+1]; }
```

1.6. Mertens Function.

Mertens function is $M(n) = \sum_{i=1}^{n} \mu(i)$. Let $L \approx (n \log\log n)^{2/3}$ and the algorithm runs in $O(n^{2/3})$.

```
#define L 9000000
int mob[L], mer[L];
unordered_map<ll,ll> mem;
ll M(ll n) {
  if (n < L) return mer[n];
  if (mem.find(n) != mem.end()) return mem[n];
  ll ans = 0, done = 1;
  for (ll i = 2; i*i <= n; i++) ans += M(n/i), done = i;
  for (ll i = 1; i*i <= n; i++)
    ans += mer[i] * (n/i - max(done, n/(i+1)));
  return mem[n] = 1 - ans; }
void sieve() {
  for (int i = 1; i < L; i++) mer[i] = mob[i] = 1;
  for (int i = 2; i < L; i++) {
    if (mer[i]) {
      mob[i] = -1;
      for (int j = i+i; j < L; j += i)
        mer[j] = 0, mob[j] = (j/i)%i == 0 ? 0 : -mob[j/i]; }
    mer[i] = mob[i] + mer[i-1]; } }
// vim: cc=60 ts=2 sts=2 sw=2:
```

1.7. Summatory Phi.

The summatory phi function $\Phi(n) = \sum_{i=1}^{n} \phi(i)$. Let $L \approx (n \log\log n)^{2/3}$ and the algorithm runs in $O(n^{2/3})$.

```
#define N 10000000
ll sp[N];
unordered_map<ll,ll> mem;
ll sumphi(ll n) {
  if (n < N) return sp[n];
  if (mem.find(n) != mem.end()) return mem[n];
  ll ans = 0, done = 1;
  for (ll i = 2; i*i <= n; i++) ans += sumphi(n/i), done = i;
  for (ll i = 1; i*i <= n; i++)
    ans += sp[i] * (n/i - max(done, n/(i+1)));
  return mem[n] = n*(n+1)/2 - ans; }
void sieve() {
  for (int i = 1; i < N; i++) sp[i] = i;
  for (int i = 2; i < N; i++) {
    if (sp[i] == i) {
      sp[i] = i-1;
      for (int j = i+i; j < N; j += i) sp[j] -= sp[j] / i; }
    sp[i] += sp[i-1]; } }
// vim: cc=60 ts=2 sts=2 sw=2:
```

1.8. Josephus problem.

Last man standing out of n if every kth is killed. Zero-based, and does not kill 0 on first pass.

```
int J(int n, int k) {
  if (n == 1) return 0;
  if (k == 1) return n-1;
  if (n < k) return (J(n-1,k)+k)%n;
  int np = n - n/k;
  return k*((J(np,k)+np-n%k%np)%np) / (k-1); }
// vim: cc=60 ts=2 sts=2 sw=2:
```

1.9. Number of Integer Points under Line.

Count the number of integer solutions to $Ax+By \le C$, $0 \le x \le n$, $0 \le y$. In other words, evaluate the sum $\sum_{x=0}^{n} \left\lfloor \frac{C-Ax}{B} + 1 \right\rfloor$. To count all solutions, let $n = \left\lfloor \frac{c}{a} \right\rfloor$. In any case, it must hold that $C - nA \ge 0$. Be very careful about overflows.

```
ll floor_sum(ll n, ll a, ll b, ll c) {
  if (c == 0) return 1;
  if (c < 0) return 0;
  if (a % b == 0) return (n+1)*(c/b+1)-n*(n+1)/2*a/b;
  if (a >= b) return floor_sum(n,a%b,b,c)-a/b*n*(n+1)/2;
  ll t = (c-a*n+b)/b;
  return floor_sum((c-b*t)/b,b,a,c-b*t)+t*(n+1); }
// vim: cc=60 ts=2 sts=2 sw=2:
```

1.10. Numbers and Sequences.

Some random prime numbers: 1031, 32771, 1048583, 8125344, 33554467, 9982451653 1073741827, 34359738421, 1099511627791, 35184372088891, 1125899906842679, 36028797018963971.

More random prime numbers: $10^3 + \{-9, -3, 9, 13\}$, $10^6 + \{-17, 3, 33\}$, $10^9 + \{7, 9, 21, 33, 87\}$.

Some maximal divisor counts:

840	32
720 720	240
735 134 400	1 344
963 761 198 400	6 720
866 421 317 361 600	26 880
897 612 484 786 617 600	103 680

2. Datastructures

2.1. Segment tree $\mathcal{O}(\log n)$. Standard segment tree

```
typedef /* Tree element */ S;
const int n = 1 << 20; S t[2 * n];

// required axiom: associativity
S combine(S l, S r) { return l + r; } // sum segment tree
S combine(S l, S r) { return max(l, r); } // max segment tree

void build() { for (int i = n; --i; ) t[i] = combine(t[2 *
↪  i], t[2 * i + 1]); }

// set value v on position i
void update(int i, S v) { for (t[i += n] = v; i /= 2; ) t[i]
↪  = combine(t[2 * i], t[2 * i + 1]);}
}

// sum on interval [l, r)
S query(int l, int r) {
  S resL, resR;
  for (l += n, r += n; l < r; l /= 2, r /= 2) {
    if (l & 1) resL = combine(resL, t[l++]);
    if (r & 1) resR = combine(t[--r], resR);
  }
  return combine(resL, resR);
}
```

Lazy segment tree

```
struct node {
  int l, r, x, lazy;
  node() {}
  node(int _l, int _r) : l(_l), r(_r), x(INF), lazy(0) { }
  node(int _l, int _r, int _x) : node(_l,_r) { x = _x; }
  node(node a, node b) : node(a.l,b.r) { x = min(a.x, b.x); }
  void update(int v) { x = v; }
  void range_update(int v) { lazy = v; }
  void apply() { x += lazy; lazy = 0; }
  void push(node &u) { u.lazy += lazy; } };

struct segment_tree {
  int n;
  vector<node> arr;
  segment_tree() { }
  segment_tree(const vector<ll> &a) : n(size(a)), arr(4*n) {
    mk(a,0,0,n-1); }
  node mk(const vector<ll> &a, int i, int l, int r) {
    int m = (l+r)/2;
    return arr[i] = l > r ? node(l,r) :
      l == r ? node(l,r,a[l]) :
      node(mk(a,2*i+1,l,m),mk(a,2*i+2,m+1,r)); }
  node update(int at, ll v, int i=0) {
    propagate(i);
    int hl = arr[i].l, hr = arr[i].r;
    if (at < hl || hr < at) return arr[i];
    if (hl == at && at == hr) {
      arr[i].update(v); return arr[i]; }
    return arr[i] =
      node(update(at,v,2*i+1),update(at,v,2*i+2)); }
  node query(int l, int r, int i=0) {
    propagate(i);
    int hl = arr[i].l, hr = arr[i].r;
    if (r < hl || hr < l) return node(hl,hr);
    if (l <= hl && hr <= r) return arr[i];
    return node(query(l,r,2*i+1),query(l,r,2*i+2)); }
  node range_update(int l, int r, ll v, int i=0) {
    propagate(i);
    int hl = arr[i].l, hr = arr[i].r;
    if (r < hl || hr < l) return arr[i];
    if (l <= hl && hr <= r)
      return arr[i].range_update(v), propagate(i), arr[i];
    return arr[i] = node(range_update(l,r,v,2*i+1),
        range_update(l,r,v,2*i+2)); }
    void propagate(int i) {
      if (arr[i].l < arr[i].r)
        arr[i].push(arr[2*i+1]), arr[i].push(arr[2*i+2]);
      arr[i].apply(); } };
```

Persistent segment tree

```
int segcnt = 0;
struct segment {
  int l, r, lid, rid, sum;
} segs[2000000];
int build(int l, int r) {
  if (l > r) return -1;
  int id = segcnt++;
  segs[id].l = l;
  segs[id].r = r;
  if (l == r) segs[id].lid = -1, segs[id].rid = -1;
  else {
    int m = (l + r) / 2;
    segs[id].lid = build(l , m);
    segs[id].rid = build(m + 1, r); }
  segs[id].sum = 0;
  return id; }
int update(int idx, int v, int id) {
  if (id == -1) return -1;
  if (idx < segs[id].l || idx > segs[id].r) return id;
  int nid = segcnt++;
  segs[nid].l = segs[id].l;
  segs[nid].r = segs[id].r;
  segs[nid].lid = update(idx, v, segs[id].lid);
  segs[nid].rid = update(idx, v, segs[id].rid);
  segs[nid].sum = segs[id].sum + v;
  return nid; }
int query(int id, int l, int r) {
  if (r < segs[id].l || segs[id].r < l) return 0;
  if (l <= segs[id].l && segs[id].r <= r) return
  ↪  segs[id].sum;
  return query(segs[id].lid, l, r)
      + query(segs[id].rid, l, r); }
```

2.2. Binary Indexed Tree $\mathcal{O}(\log n)$. Use one-based indices ($i > 0$)!

```
int bit[MAXN + 1];

// arr[i] += v
void update(int i, int v) {
  while (i <= MAXN) bit[i] += v, i += i & -i;
}

// returns sum of arr[i], where i: [1, i]
int query(int i) {
  int v = 0; while (i) v += bit[i], i -= i & -i; return v;
}
```

Use this if you add things, which depend on i:

```
struct fenwick_tree {
  int n; vi data;
  fenwick_tree(int _n) : n(_n), data(vi(n)) { }
  void update(int at, int by) {
    while (at < n) data[at] += by, at |= at + 1; }
  int query(int at) {
    int res = 0;
    while (at >= 0) res += data[at], at = (at & (at + 1)) -
    ↪  1;
    return res; }
  int rsq(int a, int b) { return query(b) - query(a - 1); }
};
struct fenwick_tree_sq {
  int n; fenwick_tree x1, x0;
  fenwick_tree_sq(int _n) : n(_n), x1(fenwick_tree(n)),
    x0(fenwick_tree(n)) { }
  // insert f(y) = my + c if x <= y
  void update(int x, int m, int c) {
    x1.update(x, m); x0.update(x, c); }
  int query(int x) { return x*x1.query(x) + x0.query(x); }
};
void range_update(fenwick_tree_sq &s, int a, int b, int k) {
  s.update(a, k, k * (1 - a)); s.update(b+1, -k, k * b); }
int range_query(fenwick_tree_sq &s, int a, int b) {
  return s.query(b) - s.query(a-1); }
```

2.3. Disjoint-Set / Union-Find $\mathcal{O}(\alpha(n))$.

```
struct dsu {
  vi par, rnk;
  dsu(int n) : par(n, -1), rnk(n, 0) {}
  int find(int i) { return par[i] < 0 ? i : par[i] =
  ↪  find(par[i]); }
  void unite(int a, int b) {
    if ((a = find(a)) == (b = find(b))) return;
    if (rnk[a] < rnk[b]) swap(a, b);
    if (rnk[a] == rnk[b]) rnk[a]++;
    par[a] += par[b]; par[b] = a;
  }
};
```

2.4. AVL Tree Balanced Binary Search Tree $\mathcal{O}(\log n)/\mathcal{O}(\log n)$.

```
#define AVL_MULTISET 0
template <class T> struct avl_tree {
```

```
  struct node {
    T item; node *p, *l, *r;
    int size, height;
    node(const T &_item, node *_p = NULL) : item(_item),
    ↪  p(_p),
    l(NULL), r(NULL), size(1), height(0) { } };

  node *root;
  avl_tree() : root(NULL) { }
  inline int sz(node *n) const { return n ? n->size : 0; }
  inline int height(node *n) const {
    return n ? n->height : -1; }
  inline bool left_heavy(node *n) const {
    return n && height(n->l) > height(n->r); }
  inline bool right_heavy(node *n) const {
    return n && height(n->r) > height(n->l); }
  inline bool too_heavy(node *n) const {
    return n && abs(height(n->l) - height(n->r)) > 1; }

  void delete_tree(node *n) { if (n) {
    delete_tree(n->l), delete_tree(n->r); delete n; } }
  node*& parent_leg(node *n) {
    if (!n->p) return root;
    if (n->p->l == n) return n->p->l;
    if (n->p->r == n) return n->p->r;
    assert(false); }
  void augment(node *n) {
    if (!n) return;
    n->size = 1 + sz(n->l) + sz(n->r);
    n->height = 1 + max(height(n->l), height(n->r)); }
  #define rotate(l, r) \
    node *l = n->l; \
    l->p = n->p; \
    parent_leg(n) = l; \
    n->l = l->r; \
    if (l->r) l->r->p = n; \
    l->r = n, n->p = l; \
    augment(n), augment(l)
  void left_rotate(node *n) { rotate(r, l); }
  void right_rotate(node *n) { rotate(l, r); }
  void fix(node *n) {
    while (n) { augment(n);
      if (too_heavy(n)) {
        if (left_heavy(n) && right_heavy(n->l))
          left_rotate(n->l);
        else if (right_heavy(n) && left_heavy(n->r))
          right_rotate(n->r);
        if (left_heavy(n)) right_rotate(n);
        else left_rotate(n);
        n = n->p; }
      n = n->p; } }
  inline int size() const { return sz(root); }
  node* find(const T &item) const {
    node *cur = root;
    while (cur) {
      if (cur->item < item) cur = cur->r;
      else if (item < cur->item) cur = cur->l;
      else break; }
    return cur; }
  node* insert(const T &item) {
    node *prev = NULL, **cur = &root;
    while (*cur) {
      prev = *cur;
      if ((*cur)->item < item) cur = &((*cur)->r);
#if AVL_MULTISET
      else cur = &((*cur)->l);
#else
      else if (item < (*cur)->item) cur = &((*cur)->l);
      else return *cur;
#endif
    }
    node *n = new node(item, prev);
    *cur = n, fix(n); return n; }
  void erase(const T &item) { erase(find(item)); }
  void erase(node *n, bool free = true) {
    if (!n) return;
    if (!n->l && n->r) parent_leg(n) = n->r, n->r->p = n->p;
    else if (n->l && !n->r)
      parent_leg(n) = n->l, n->l->p = n->p;
    else if (n->l && n->r) {
      node *s = successor(n);
      erase(s, false);
      s->p = n->p, s->l = n->l, s->r = n->r;
      if (n->l) n->l->p = s;
      if (n->r) n->r->p = s;
      parent_leg(n) = s, fix(s);
      return;
    } else parent_leg(n) = NULL;
    fix(n->p), n->p = n->l = n->r = NULL;
    if (free) delete n; }
  node* successor(node *n) const {
    if (!n) return NULL;
    if (n->r) return nth(0, n->r);
    node *p = n->p;
    while (p && p->r == n) n = p, p = p->p;
    return p; }
  node* predecessor(node *n) const {
    if (!n) return NULL;
    if (n->l) return nth(n->l->size-1, n->l);
    node *p = n->p;
    while (p && p->l == n) n = p, p = p->p;
    return p; }
  node* nth(int n, node *cur = NULL) const {
    if (!cur) cur = root;
    while (cur) {
      if (n < sz(cur->l)) cur = cur->l;
      else if (n > sz(cur->l))
        n -= sz(cur->l) + 1, cur = cur->r;
      else break;
    } return cur; }
  int count_less(node *cur) {
    int sum = sz(cur->l);
    while (cur) {
      if (cur->p && cur->p->r == cur) sum += 1 +
      ↪  sz(cur->p->l);
      cur = cur->p;
    } return sum; }
  void clear() { delete_tree(root), root = NULL; } };
```

Use this easy implementation for a map:

```
template <class K, class V> struct avl_map {
  struct node {
    K key; V value;
    node(K k, V v) : key(k), value(v) { }
    bool operator <(const node &other) const {
      return key < other.key; } };
  avl_tree<node> tree;
  V& operator [](K key) {
    typename avl_tree<node>::node *n =
      tree.find(node(key, V(0)));
    if (!n) n = tree.insert(node(key, V(0)));
    return n->item.value; } };
```

2.5. Cartesian tree.

```
struct node {
  int x, y, sz;
  node *l, *r;
  node(int _x, int _y)
    : x(_x), y(_y), sz(1), l(NULL), r(NULL) { } };
int tsize(node* t) { return t ? t->sz : 0; }
void augment(node *t) {
  t->sz = 1 + tsize(t->l) + tsize(t->r); }
pair<node*,node*> split(node *t, int x) {
  if (!t) return make_pair((node*)NULL,(node*)NULL);
  if (t->x < x) {
    pair<node*,node*> res = split(t->r, x);
    t->r = res.first; augment(t);
    return make_pair(t, res.second); }
  pair<node*,node*> res = split(t->l, x);
  t->l = res.second; augment(t);
  return make_pair(res.first, t); }
node* merge(node *l, node *r) {
  if (!l) return r; if (!r) return l;
  if (l->y > r->y) {
    l->r = merge(l->r, r); augment(l); return l; }
  r->l = merge(l, r->l); augment(r); return r; }
node* find(node *t, int x) {
  while (t) {
    if (x < t->x) t = t->l;
    else if (t->x < x) t = t->r;
    else return t; }
  return NULL; }
node* insert(node *t, int x, int y) {
  if (find(t, x) != NULL) return t;
  pair<node*,node*> res = split(t, x);
  return merge(res.first,
      merge(new node(x, y), res.second)); }
```

```
node* erase(node *t, int x) {
  if (!t) return NULL;
  if (t->x < x) t->r = erase(t->r, x);
  else if (x < t->x) t->l = erase(t->l, x);
  else { node *old = t; t = merge(t->l, t->r); delete old; }
  if (t) augment(t); return t; }
int kth(node *t, int k) {
  if (k < tsize(t->l)) return kth(t->l, k);
  else if (k == tsize(t->l)) return t->x;
  else return kth(t->r, k - tsize(t->l) - 1); }
```

2.6. **Heap.** An implementation of a binary heap.

```
#define RESIZE
#define SWP(x,y) tmp = x, x = y, y = tmp
struct default_int_cmp {
  default_int_cmp() { }
  bool operator ()(const int &a, const int &b) {
    return a < b; } };
template <class Compare = default_int_cmp> struct heap {
  int len, count, *q, *loc, tmp;
  Compare _cmp;
  inline bool cmp(int i, int j) { return _cmp(q[i], q[j]); }
  inline void swp(int i, int j) {
    SWP(q[i], q[j]), SWP(loc[q[i]], loc[q[j]]); }
  void swim(int i) {
    while (i > 0) {
      int p = (i - 1) / 2;
      if (!cmp(i, p)) break;
      swp(i, p), i = p; } }
  void sink(int i) {
    while (true) {
      int l = 2*i + 1, r = l + 1;
      if (l >= count) break;
      int m = r >= count || cmp(l, r) ? l : r;
      if (!cmp(m, i)) break;
      swp(m, i), i = m; } }
  heap(int init_len = 128)
    : count(0), len(init_len), _cmp(Compare()) {
    q = new int[len], loc = new int[len];
    memset(loc, 255, len << 2); }
  ~heap() { delete[] q; delete[] loc; }
  void push(int n, bool fix = true) {
    if (len == count || n >= len) {
#ifdef RESIZE
      int newlen = 2 * len;
      while (n >= newlen) newlen *= 2;
      int *newq = new int[newlen], *newloc = new int[newlen];
      rep(i,0,len) newq[i] = q[i], newloc[i] = loc[i];
      memset(newloc + len, 255, (newlen - len) << 2);
      delete[] q, delete[] loc;
      loc = newloc, q = newq, len = newlen;
#else
      assert(false);
#endif
    }
    assert(loc[n] == -1);
    loc[n] = count, q[count++] = n;
    if (fix) swim(count-1); }
  void pop(bool fix = true) {
    assert(count > 0);
    loc[q[0]] = -1, q[0] = q[--count], loc[q[0]] = 0;
    if (fix) sink(0);
  }
  int top() { assert(count > 0); return q[0]; }
  void heapify() { for (int i = count - 1; i > 0; i--)
    if (cmp(i, (i - 1) / 2)) swp(i, (i - 1) / 2); }
  void update_key(int n) {
    assert(loc[n] != -1), swim(loc[n]), sink(loc[n]); }
  bool empty() { return count == 0; }
  int size() { return count; }
  void clear() { count = 0, memset(loc, 255, len << 2); }};
```

2.7. **Dancing Links.** An implementation of Donald Knuth's Dancing Links data structure. A linked list supporting deletion and restoration of elements.

```
template <class T>
struct dancing_links {
  struct node {
    T item;
    node *l, *r;
    node(const T &_item, node *_l = NULL, node *_r = NULL)
      : item(_item), l(_l), r(_r) {
      if (l) l->r = this;
      if (r) r->l = this; } };
  node *front, *back;
  dancing_links() { front = back = NULL; }
  node *push_back(const T &item) {
    back = new node(item, back, NULL);
    if (!front) front = back;
    return back; }
  node *push_front(const T &item) {
    front = new node(item, NULL, front);
    if (!back) back = front;
    return front; }
  void erase(node *n) {
    if (!n->l) front = n->r; else n->l->r = n->r;
    if (!n->r) back = n->l; else n->r->l = n->l; }
  void restore(node *n) {
    if (!n->l) front = n; else n->l->r = n;
    if (!n->r) back = n; else n->r->l = n; } };
```

2.8. **Misof Tree.** A simple tree data structure for inserting, erasing, and querying the nth largest element.

```
#define BITS 15
struct misof_tree {
  int cnt[BITS][1<<BITS];
  misof_tree() { memset(cnt, 0, sizeof(cnt)); }
  void insert(int x) {
    for (int i = 0; i < BITS; cnt[i++][x]++, x >>= 1); }
  void erase(int x) {
    for (int i = 0; i < BITS; cnt[i++][x]--, x >>= 1); }
  int nth(int n) {
    int res = 0;
    for (int i = BITS-1; i >= 0; i--)
      if (cnt[i][res <<= 1] <= n) n -= cnt[i][res], res |= 1;
    return res; } };
```

2.9. ***k*-d Tree.** A k-dimensional tree supporting fast construction, adding points, and nearest neighbor queries. NOTE: Not completely stable, occasionally segfaults.

```
#define INC(c) ((c) == K - 1 ? 0 : (c) + 1)
template <int K> struct kd_tree {
  struct pt {
    double coord[K];
    pt() {}
    pt(double c[K]) { rep(i,0,K) coord[i] = c[i]; }
    double dist(const pt &other) const {
      double sum = 0.0;
      rep(i,0,K) sum += pow(coord[i] - other.coord[i], 2.0);
      return sqrt(sum); } };

        resp = res.first, found = true;
    }
    return make_pair(resp, found); } };
```

2.10. Sqrt Decomposition. Design principle that supports many operations in amortized $\sqrt{n}$ per operation.

```
struct segment {
  vi arr;
  segment(vi _arr) : arr(_arr) { } };
vector&lt;segment&gt; T;
int K;
void rebuild() {
  int cnt = 0;
  rep(i,0,size(T))
    cnt += size(T[i].arr);
  K = static_cast<int>(ceil(sqrt(cnt)) + 1e-9);
  vi arr(cnt);
  for (int i = 0, at = 0; i < size(T); i++)
    rep(j,0,size(T[i].arr))
      arr[at++] = T[i].arr[j];
  T.clear();
  for (int i = 0; i < cnt; i += K)
    T.push_back(segment(vi(arr.begin()+i,
                           arr.begin()+min(i+K, cnt)))); }
int split(int at) {
  int i = 0;
  while (i < size(T) && at >= size(T[i].arr))
    at -= size(T[i].arr), i++;
  if (i >= size(T)) return size(T);
  if (at == 0) return i;
  T.insert(T.begin() + i + 1,
      segment(vi(T[i].arr.begin() + at, T[i].arr.end())));
  T[i] = segment(vi(T[i].arr.begin(), T[i].arr.begin() +
    at));
  return i + 1; }
void insert(int at, int v) {
  vi arr; arr.push_back(v);
  T.insert(T.begin() + split(at), segment(arr)); }
void erase(int at) {
  int i = split(at); split(at + 1);
  T.erase(T.begin() + i); }
// vim: cc=60 ts=2 sts=2 sw=2:
```

2.11. Monotonic Queue. A queue that supports querying for the minimum element. Useful for sliding window algorithms.

```
struct min_stack {
  stack<int> S, M;
  void push(int x) {
    S.push(x);
    M.push(M.empty() ? x : min(M.top(), x)); }
  int top() { return S.top(); }
  int mn() { return M.top(); }
  void pop() { S.pop(); M.pop(); }
  bool empty() { return S.empty(); } };
struct min_queue {
  min_stack inp, outp;
  void push(int x) { inp.push(x); }
  void fix() {
    if (outp.empty()) while (!inp.empty())
      outp.push(inp.top()), inp.pop(); }
  int top() { fix(); return outp.top(); }
  int mn() {
    if (inp.empty()) return outp.mn();
    if (outp.empty()) return inp.mn();
    return min(inp.mn(), outp.mn()); }
  void pop() { fix(); outp.pop(); }
  bool empty() { return inp.empty() && outp.empty(); } };
```

2.12. Convex Hull Trick. If converting to integers, look out for division by 0 and $\pm\infty$.

```
struct convex_hull_trick {
  vector<pair<double,double> > h;
  double intersect(int i) {
    return (h[i+1].second-h[i].second) /
      (h[i].first-h[i+1].first); }
  void add(double m, double b) {
    h.push_back(make_pair(m,b));
    while (size(h) >= 3) {
      int n = size(h);
      if (intersect(n-3) < intersect(n-2)) break;
      swap(h[n-2], h[n-1]);
      h.pop_back(); } }
  double get_min(double x) {
    int lo = 0, hi = size(h) - 2, res = -1;
    while (lo <= hi) {
      int mid = lo + (hi - lo) / 2;
      if (intersect(mid) <= x) res = mid, lo = mid + 1;
      else hi = mid - 1; }
    return h[res+1].first * x + h[res+1].second; } };
```

And dynamic variant:

```
const ll is_query = -(1LL<<62);
struct Line {
  ll m, b;
  mutable function<const Line*()> succ;
  bool operator<(const Line& rhs) const {
    if (rhs.b != is_query) return m < rhs.m;
    const Line* s = succ();
    if (!s) return 0;
    ll x = rhs.m;
    return b - s->b < (s->m - m) * x; } };
// will maintain upper hull for maximum
struct HullDynamic : public multiset<Line> {
  bool bad(iterator y) {
    auto z = next(y);
    if (y == begin()) {
      if (z == end()) return 0;
      return y->m == z->m && y->b <= z->b; }
    auto x = prev(y);
    if (z == end()) return y->m == x->m && y->b <= x->b;
    return (x->b - y->b)*(z->m - y->m) >=
           (y->b - z->b)*(y->m - x->m); }
  void insert_line(ll m, ll b) {
    auto y = insert({ m, b });
    y->succ = [=] { return next(y) == end() ? 0 : &*next(y);
      };
    if (bad(y)) { erase(y); return; }
    while (next(y) != end() && bad(next(y))) erase(next(y));
    while (y != begin() && bad(prev(y))) erase(prev(y)); }
  ll eval(ll x) {
    auto l = *lower_bound((Line) { x, is_query });
    return l.m * x + l.b; } };
```

2.13. **Sparse Table.**

```
struct sparse_table { vvi m;
  sparse_table(vi arr) {
    m.push_back(arr);
    for (int k = 0; (1<<(++k)) <= size(arr); ) {
      m.push_back(vi(size(arr)-(1<<k)+1));
      rep(i,0,size(arr)-(1<<k)+1)
        m[k][i] = min(m[k-1][i], m[k-1][i+(1<<(k-1))]); } }
  int query(int l, int r) {
    int k = 0; while (1<<(k+1) <= r-l+1) k++;
    return min(m[k][l], m[k][r-(1<<k)+1]); } };
```

3. Graph Algorithms

3.1. **Shortest path.**

3.1.1. *Dijkstra* $\mathcal{O}(|E|\log|V|)$.

```
int *dist, *dad;
struct cmp {
  bool operator()(int a, int b) {
    return dist[a] != dist[b] ? dist[a] < dist[b] : a < b; }
};
pair<int*, int*> dijkstra(int n, int s, vii *adj) {
  dist = new int[n];
  dad = new int[n];
  rep(i,0,n) dist[i] = INF, dad[i] = -1;
  set<int, cmp> pq;
  dist[s] = 0, pq.insert(s);
  while (!pq.empty()) {
    int cur = *pq.begin(); pq.erase(pq.begin());
    rep(i,0,size(adj[cur])) {
      int nxt = adj[cur][i].first,
        ndist = dist[cur] + adj[cur][i].second;
      if (ndist < dist[nxt]) pq.erase(nxt),
        dist[nxt] = ndist, dad[nxt] = cur, pq.insert(nxt);
    } }
  return pair<int*, int*>(dist, dad); }
```

3.1.2. *Floyd-Warshall* $\mathcal{O}(V^3)$.

```
int n = 100; ll d[MAXN][MAXN];
for (int i = 0; i < n; i++) fill_n(d[i], n, 1e18);
// set direct distances from i to j in d[i][j] (and d[j][i])
for (int i = 0; i < n; i++)
  for (int j = 0; j < n; j++)
    for (int k = 0; k < n; k++)
      d[j][k] = min(d[j][k], d[j][i] + d[i][k]);
```

3.1.3. *Bellman Ford* $\mathcal{O}(VE)$. This is only useful if there are edges with weight $w_{ij} < 0$ in the graph.

```
vector< pair<pii, ll> > edges; // ((from, to), weight)
vector<ll> dist;

// when undirected, add back edges
bool bellman_ford(int V, int source) {
  dist.assign(V, 1e18); dist[source] = 0;

  bool updated = true; int loops = 0;
  while (updated && loops < n) {
    updated = false;
    for (auto e : edges) {
      int alt = dist[e.x.x] + e.y;
      if (alt < dist[e.x.y]) {
        dist[e.x.y] = alt; updated = true;
      }
    }
  }
  return loops < n; // loops >= n: negative cycles
}
```

3.1.4. *IDA* algorithm.*

```
int n, cur[100], pos;
int calch() {
  int h = 0;
  rep(i,0,n) if (cur[i] != 0) h += abs(i - cur[i]);
  return h; }
int dfs(int d, int g, int prev) {
  int h = calch();
  if (g + h > d) return g + h;
  if (h == 0) return 0;
  int mn = INF;
  rep(di,-2,3) {
    if (di == 0) continue;
    int nxt = pos + di;
    if (nxt == prev) continue;
    if (0 <= nxt && nxt < n) {
      swap(cur[pos], cur[nxt]);
      swap(pos,nxt);
      mn = min(mn, dfs(d, g+1, nxt));
      swap(pos,nxt);
      swap(cur[pos], cur[nxt]); }
    if (mn == 0) break; }
  return mn; }
int idastar() {
  rep(i,0,n) if (cur[i] == 0) pos = i;
  int d = calch();
  while (true) {
    int nd = dfs(d, 0, -1);
    if (nd == 0 || nd == INF) return d;
    d = nd; } }
```

3.2. **Maximum matching** $\mathcal{O}(nm)$.

```
const int sizeL = 1e4, sizeR = 1e4;

bool vis[sizeR];
int par[sizeR]; // par : R -> L
vi adj[sizeL]; // adj : L -> (N -> R)

bool match(int u) {
  for (int v : adj[u]) {
    if (vis[v]) continue; vis[v] = true;
    if (par[v] == -1 || match(par[v])) {
      par[v] = u;
      return true;
    }
  }
  return false;
}

// perfect matching iff ret == sizeL == sizeR
int maxmatch() {
  fill_n(par, sizeR, -1); int ret = 0;
  for (int i = 0; i < sizeL; i++) {
    fill_n(vis, sizeR, false);
    ret += match(i);
  }
  return ret;
}
```

3.3. **Hopcroft-Karp bipartite matching** $\mathcal{O}(E\sqrt{V})$.

```
#define MAXN 5000
int dist[MAXN+1], q[MAXN+1];
#define dist(v) dist[v == -1 ? MAXN : v]
struct bipartite_graph {
  int N, M, *L, *R; vi *adj;
  bipartite_graph(int _N, int _M) : N(_N), M(_M),
    L(new int[N]), R(new int[M]), adj(new vi[N]) {}
  ~bipartite_graph() { delete[] adj; delete[] L; delete[] R;
  ↪ }
  bool bfs() {
    int l = 0, r = 0;
    rep(v,0,N) if(L[v] == -1) dist(v) = 0, q[r++] = v;

// vim: cc=60 ts=2 sts=2 sw=2:
```

3.18. **Maximum Density Subgraph.** Given (weighted) undirected graph G. Binary search density. If g is current density, construct flow network: (S,u,m), $(u,T,m+2g-d_u)$, $(u,v,1)$, where m is a large constant (larger than sum of edge weights). Run floating-point max-flow. If minimum cut has empty S-component, then maximum density is smaller than g, otherwise it's larger. Distance between valid densities is at least $1/(n(n-1))$. Edge case when density is 0. This also works for weighted graphs by replacing d_u by the weighted degree, and doing more iterations (if weights are not integers).

3.19. **Maximum-Weight Closure.** Given a vertex-weighted directed graph G. Turn the graph into a flow network, adding weight ∞ to each edge. Add vertices S,T. For each vertex v of weight w, add edge (S,v,w) if $w \geq 0$, or edge $(v,T,-w)$ if $w < 0$. Sum of positive weights minus minimum $S-T$ cut is the answer. Vertices reachable from S are in the closure. The maximum-weight closure is the same as the complement of the minimum-weight closure on the graph with edges reversed.

3.20. **Maximum Weighted Independent Set in a Bipartite Graph.** This is the same as the minimum weighted vertex cover. Solve this by constructing a flow network with edges $(S,u,w(u))$ for $u \in L$, $(v,T,w(v))$ for $v \in R$ and (u,v,∞) for $(u,v) \in E$. The minimum S,T-cut is the answer. Vertices adjacent to a cut edge are in the vertex cover.

3.21. **Synchronizing word problem.** A DFA has a synchronizing word (an input sequence that moves all states to the same state) iff. each pair of states has a synchronizing word. That can be checked using reverse DFS over pairs of states. Finding the shortest synchronizing word is NP-complete.

4. String algorithms

4.1. Trie.

```
const int SIGMA = 26;

struct trie {
  bool word; trie **adj;

  trie() : word(false), adj(new trie*[SIGMA]) {
    for (int i = 0; i < SIGMA; i++) adj[i] = NULL;
  }

  void addWord(const string &str) {
    trie *cur = this;
    for (char ch : str) {
      int i = ch - 'a';
      if (!cur->adj[i]) cur->adj[i] = new trie();
      cur = cur->adj[i];
    }
    cur->word = true;
  }

  bool isWord(const string &str) {
    trie *cur = this;
    for (char ch : str) {
      int i = ch - 'a';
      if (!cur->adj[i]) return false;
      cur = cur->adj[i];
    }
    return cur->word;
  }
};
```

4.2. Z-algorithm $\mathcal{O}(n)$.

```
// z[i] = length of longest substring starting from s[i]
↪  which is also a prefix of s.
vi z_function(const string &s) {
  int n = (int) s.length();
  vi z(n);
  for (int i = 1, l = 0, r = 0; i < n; ++i) {
    if (i <= r) z[i] = min (r - i + 1, z[i - l]);
    while (i + z[i] < n && s[z[i]] == s[i + z[i]]) ++z[i];
    if (i + z[i] - 1 > r) l = i, r = i + z[i] - 1;
  }
  return z;
}
```

4.3. **Suffix array** $\mathcal{O}(n\log^2 n)$**.** This creates an array $P[0],P[1],\ldots,P[n-1]$ such that the suffix $S[i\ldots n]$ is the $P[i]^{th}$ suffix of S when lexicographically sorted.

```
typedef pair<pii, int> tii;

const int maxlogn = 17, int maxn = 1 << maxlogn;

tii make_triple(int a, int b, int c) { return tii(pii(a, b),
↪  c); }

int p[maxlogn + 1][maxn]; tii L[maxn];

int suffixArray(string S) {
  int N = S.size(), stp = 1, cnt = 1;
  for (int i = 0; i < N; i++) p[0][i] = S[i];
  for (; cnt < N; stp++, cnt <<= 1) {
    for (int i = 0; i < N; i++)
      L[i] = tii(pii(p[stp-1][i], i + cnt < N ? p[stp-1][i +
      ↪  cnt] : -1), i);
    sort(L, L + N);
    for (int i = 0; i < N; i++)
      p[stp][L[i].y] = i > 0 && L[i].x == L[i-1].x ?
      ↪  p[stp][L[i-1].y] : i;
  }
  return stp - 1; // result is in p[stp - 1][0 .. (N - 1)]
}
```

4.4. **Longest Common Subsequence** $\mathcal{O}(n^2)$. SUBSTRING: *consecutive characters* !!!

```
int dp[STR_SIZE][STR_SIZE]; // DP problem

int lcs(const string &w1, const string &w2) {
  int n1 = w1.size(), n2 = w2.size();
  for (int i = 0; i < n1; i++) {
    for (int j = 0; j < n2; j++) {
      if (i == 0 || j == 0) dp[i][j] = 0;
      else if (w1[i - 1] == w2[j - 1]) dp[i][j] = dp[i - 1][j
      ↪  - 1] + 1;
      else dp[i][j] = max(dp[i - 1][j], dp[i][j - 1]);
    }
  }
  return dp[n1][n2];
}

// backtrace
string getLCS(const string &w1, const string &w2) {
  int i = w1.size(), j = w2.size(); string ret = "";
  while (i > 0 && j > 0) {
    if (w1[i - 1] == w2[j - 1]) ret += w1[--i], j--;
    else if (dp[i][j - 1] > dp[i - 1][j]) j--;
    else i--;
  }
  reverse(ret.begin(), ret.end());
  return ret;
}
```

4.5. **Levenshtein Distance** $\mathcal{O}(n^2)$. Also known as the 'Edit distance'.

```
int dp[MAX_SIZE][MAX_SIZE]; // DP problem

int levDist(const string &w1, const string &w2) {
  int n1 = w1.size(), n2 = w2.size();
  for (int i = 0; i <= n1; i++) dp[i][0] = i; // removal
  for (int j = 0; j <= n2; j++) dp[0][j] = j; // insertion
  for (int i = 1; i <= n1; i++)
    for (int j = 1; j <= n2; j++)
      dp[i][j] = min(
        1 + min(dp[i - 1][j], dp[i][j - 1]),
        dp[i - 1][j - 1] + (w1[i - 1] != w2[j - 1])
      );
  return dp[n1][n2];
}
```

4.6. **Knuth-Morris-Pratt algorithm** $\mathcal{O}(N + M)$.

```
int kmp_search(const string &word, const string &text) {
  int n = word.size();
  vi T(n + 1, 0);
  for (int i = 1, j = 0; i < n; ) {
    if (word[i] == word[j]) T[++i] = ++j; // match
    else if (j > 0) j = T[j]; // fallback
    else i++; // no match, keep zero
  }
  int matches = 0;
  for (int i = 0, j = 0; i < text.size(); ) {
    if (text[i] == word[j]) {
      i++;
      if (++j == n) { // match at interval [i - n, i)
        matches++; j = T[j];
      }
    } else if (j > 0) j = T[j];
    else i++;
  }
  return matches;
}
```

4.7. **Aho-Corasick Algorithm** $\mathcal{O}(N + \sum_{i=1}^{m} |S_i|)$. All given P must be unique!

```
const int MAXP = 100, MAXLEN = 200, SIGMA = 26, MAXTRIE =
↪  MAXP * MAXLEN;

int nP;
string P[MAXP], S;

int pnr[MAXTRIE], to[MAXTRIE][SIGMA], sLink[MAXTRIE],
↪  dLink[MAXTRIE], nnodes;

void ahoCorasick() {
  fill_n(pnr, MAXTRIE, -1);
  for (int i = 0; i < MAXTRIE; i++) fill_n(to[i], SIGMA, 0);
  fill_n(sLink, MAXTRIE, 0); fill_n(dLink, MAXTRIE, 0);
  nnodes = 1;
  // STEP 1: MAKE A TREE
  for (int i = 0; i < nP; i++) {
    int cur = 0;
    for (char c : P[i]) {
      int i = c - 'a';
      if (to[cur][i] == 0) to[cur][i] = nnodes++;
      cur = to[cur][i];
    }
    pnr[cur] = i;
  }
  // STEP 2: CREATE SUFFIX_LINKS AND DICT_LINKS
  queue<int> q; q.push(0);
  while (!q.empty()) {
    int cur = q.front(); q.pop();
    for (int c = 0; c < SIGMA; c++) {
      if (to[cur][c]) {
        int sl = sLink[to[cur][c]] = cur == 0 ? 0 :
        ↪  to[sLink[cur]][c];
        // if all strings have equal length, remove this:
        dLink[to[cur][c]] = pnr[sl] >= 0 ? sl : dLink[sl];
        q.push(to[cur][c]);
      } else to[cur][c] = to[sLink[cur]][c];
    }
  }
  // STEP 3: TRAVERSE S
  for (int cur = 0, i = 0, n = S.size(); i < n; i++) {
    cur = to[cur][S[i] - 'a'];
    for (int hit = pnr[cur] >= 0 ? cur : dLink[cur]; hit; hit
    ↪  = dLink[hit]) {
      cerr << P[pnr[hit]] << " found at [" << (i + 1 -
      ↪  P[pnr[hit]].size()) << ", " << i << "]" << endl;
    }
  }
}
```

4.8. **eerTree.** Constructs an eerTree in $O(n)$, one character at a time.

```
#define MAXN 100100
#define SIGMA 26
#define BASE 'a'
char *s = new char[MAXN];
struct state {
  int len, link, to[SIGMA];
} *st = new state[MAXN+2];
struct eertree {
  int last, sz, n;
  eertree() : last(1), sz(2), n(0) {
    st[0].len = st[0].link = -1;
    st[1].len = st[1].link = 0; }
  int extend() {
    char c = s[n++]; int p = last;
    while (n - st[p].len - 2 < 0 || c != s[n - st[p].len -
    ↪  2])
      p = st[p].link;
    if (!st[p].to[c-BASE]) {
      int q = last = sz++;
      st[p].to[c-BASE] = q;
      st[q].len = st[p].len + 2;
      do { p = st[p].link;
      } while (p != -1 && (n < st[p].len + 2 ||
               c != s[n - st[p].len - 2]));
      if (p == -1) st[q].link = 1;
      else st[q].link = st[p].to[c-BASE];
      return 1; }
    last = st[p].to[c-BASE];
    return 0; } };
// vim: cc=60 ts=2 sts=2 sw=2:
```

4.9. **Suffix Automaton.** Minimum automata that accepts all suffixes of a string with $O(n)$ construction. The automata itself is a DAG therefore suitable for DP, examples are counting unique substrings, occurrences of substrings and suffix.

```
// TODO: Add longest common subsring
const int MAXL = 100000;
struct suffix_automaton {
  vi  len, link, occur, cnt;
  vector<map<char,int> > next;
  vector<bool> isclone;
  ll *occuratleast;
  int sz, last;
  string s;
  suffix_automaton() : len(MAXL*2), link(MAXL*2),
    occur(MAXL*2), next(MAXL*2), isclone(MAXL*2) { clear(); }
  void clear() { sz = 1; last = len[0] = 0; link[0] = -1;
                 next[0].clear(); isclone[0] = false; }
  bool issubstr(string other){
```

```
    for(int i = 0, cur = 0; i < size(other); ++i){
      if(cur == -1) return false; cur = next[cur][other[i]];
      ↪  }
    return true; }
  void extend(char c){ int cur = sz++; len[cur] =
↪  len[last]+1;
    next[cur].clear(); isclone[cur] = false; int p = last;
    for(; p != -1 && !next[p].count(c); p = link[p])
      next[p][c] = cur;
    if(p == -1){ link[cur] = 0; }
    else{ int q = next[p][c];
      if(len[p] + 1 == len[q]){ link[cur] = q; }
      else { int clone = sz++; isclone[clone] = true;
        len[clone] = len[p] + 1;
        link[clone] = link[q]; next[clone] = next[q];

5.6. Polygon Centroid.

$$C_x = \frac{1}{6A}\sum_{i=0}^{n-1}(x_i + x_{i+1})(x_i y_{i+1} - x_{i+1} y_i)$$

$$C_y = \frac{1}{6A}\sum_{i=0}^{n-1}(y_i + y_{i+1})(x_i y_{i+1} - x_{i+1} y_i)$$

$$A = \frac{1}{2}\sum_{i=0}^{n-1}(x_i y_{i+1} - x_{i+1} y_i)$$

5.7. Rectilinear Minimum Spanning Tree.

Given a set of n points in the plane, and the aim is to find a minimum spanning tree connecting these n points, assuming the Manhattan distance is used. The function `candidates` returns at most $4n$ edges that are a superset of the edges in a minimum spanning tree, and then one can use Kruskal's algorithm.

```cpp
#define MAXN 100100
struct RMST {
  struct point {
    int i; ll x, y;
    point() : i(-1) { }
    ll d1() { return x + y; }
    ll d2() { return x - y; }
    ll dist(point other) {
      return abs(x - other.x) + abs(y - other.y); }
    bool operator <(const point &other) const {
      return y == other.y ? x > other.x : y < other.y; }
  } best[MAXN], arr[MAXN], tmp[MAXN];
  int n;
  RMST() : n(0) {}
  void add_point(int x, int y) {
    arr[arr[n].i = n].x = x, arr[n++].y = y; }
  void rec(int l, int r) {
    if (l >= r) return;
    int m = (l+r)/2;
    rec(l,m), rec(m+1,r);
    point bst;
    for (int i = l, j = m+1, k = l; i <= m || j <= r; k++) {
      if (j > r || (i <= m && arr[i].d1() < arr[j].d1())) {
        tmp[k] = arr[i++];
        if (bst.i != -1 && (best[tmp[k].i].i == -1
                            || best[tmp[k].i].d2() < bst.d2()))
          best[tmp[k].i] = bst;
      } else {
        tmp[k] = arr[j++];
        if (bst.i == -1 || bst.d2() < tmp[k].d2())
          bst = tmp[k]; } }
    rep(i,l,r+1) arr[i] = tmp[i]; }
  vector<pair<ll,ii> > candidates() {
    vector<pair<ll, ii> > es;
    rep(p,0,2) {
      rep(q,0,2) {
        sort(arr, arr+n);
        rep(i,0,n) best[i].i = -1;
        rec(0,n-1);
        rep(i,0,n) {
          if(best[arr[i].i].i != -1)
            es.push_back({arr[i].dist(best[arr[i].i]),
                          {arr[i].i, best[arr[i].i].i}});
          swap(arr[i].x, arr[i].y);
          arr[i].x *= -1, arr[i].y *= -1; } }
      rep(i,0,n) arr[i].x *= -1; }
    return es; } };
// vim: cc=60 ts=2 sts=2 sw=2:
```

5.8. Formulas.

Let $a = (a_x, a_y)$ and $b = (b_x, b_y)$ be two-dimensional vectors.

- $a \cdot b = |a||b|\cos\theta$, where θ is the angle between a and b.
- $a \times b = |a||b|\sin\theta$, where θ is the signed angle between a and b.
- $a \times b$ is equal to the area of the parallelogram with two of its sides formed by a and b. Half of that is the area of the triangle formed by a and b.
- **Euler's formula:** $V - E + F = 2$
- Side lengths a, b, c can form a triangle iff. $a + b > c$, $b + c > a$ and $a + c > b$.
- Sum of internal angles of a regular convex n-gon is $(n-2)\pi$.
- **Law of sines:** $\frac{a}{\sin A} = \frac{b}{\sin B} = \frac{c}{\sin C}$
- **Law of cosines:** $b^2 = a^2 + c^2 - 2ac\cos B$
- Internal tangents of circles $(c_1, r_1), (c_2, r_2)$ intersect at $(c_1 r_2 + c_2 r_1)/(r_1 + r_2)$, external intersect at $(c_1 r_2 - c_2 r_1)/(r_1 + r_2)$.

6. Miscellaneous

6.1. Binary search $\mathcal{O}(\log(hi - lo))$.

```cpp
bool test(int n);

int search(int lo, int hi) {
  // assert(test(lo) && !test(hi));
  while (hi - lo > 1) {
    int m = (lo + hi) / 2;
    (test(m) ? lo : hi) = m;
  }
  // assert(test(lo) && !test(hi));
  return lo;
}
```

6.2. Fast Fourier Transform $\mathcal{O}(n \log n)$.

Given two polynomials $A(x) = a_0 + a_1 x + \cdots + a_{n/2} x^{n/2}$ and $B(x) = b_0 + b_1 x + \cdots + b_{n/2} x^{n/2}$, FFT calculates all coefficients of $C(x) = A(x) \cdot B(x) = c_0 + c_1 x + \ldots c_n x^n$, with $c_i = \sum_{j=0}^{i} a_j b_{i-j}$.

```cpp
typedef complex<double> cpx;
const int logmaxn = 20, maxn = 1 << logmaxn;

cpx a[maxn] = {}, b[maxn] = {}, c[maxn];

void fft(cpx *src, cpx *dest) {
  for (int i = 0, rep = 0; i < maxn; i++, rep = 0) {
    for (int j = i, k = logmaxn; k--; j >>= 1) rep = (rep << 1) | (j & 1);
    dest[rep] = src[i];
  }
  for (int s = 1, m = 1; m <= maxn; s++, m *= 2) {
    cpx r = exp(cpx(0, 2.0 * PI / m));
    for (int k = 0; k < maxn; k += m) {
      cpx cr(1.0, 0.0);
      for (int j = 0; j < m / 2; j++) {
        cpx t = cr * dest[k + j + m / 2]; dest[k + j + m / 2] = dest[k + j] - t;
        dest[k + j] += t; cr *= r;
      }
    }
  }
}

void multiply() {
```

```
  fft(a, c); fft(b, a);
  for (int i = 0; i < maxn; i++) b[i] = conj(a[i] * c[i]);
  fft(b, c);
  for (int i = 0; i < maxn; i++) c[i] = conj(c[i]) / (1.0 *
  ↪  maxn);
}
```

6.3. Minimum Assignment (Hungarian Algorithm) $\mathcal{O}(n^3)$.

```
int a[MAXN + 1][MAXM + 1]; // matrix, 1-based

int minimum_assignment(int n, int m) { // n rows, m columns
  vi u(n + 1), v(m + 1), p(m + 1), way(m + 1);

  for (int i = 1; i <= n; i++) {
    p[0] = i;
    int j0 = 0;
    vi minv(m + 1, INF);
    vector<char> used(m + 1, false);
    do {
      used[j0] = true;
      int i0 = p[j0], delta = INF, j1;
      for (int j = 1; j <= m; j++)
        if (!used[j]) {
          int cur = a[i0][j] - u[i0] - v[j];
          if (cur < minv[j]) minv[j] = cur, way[j] = j0;
          if (minv[j] < delta) delta = minv[j], j1 = j;
        }
      for (int j = 0; j <= m; j++) {
        if(used[j]) u[p[j]] += delta, v[j] -= delta;
        else minv[j] -= delta;
      }
      j0 = j1;
    } while (p[j0] != 0);
    do {
      int j1 = way[j0]; p[j0] = p[j1]; j0 = j1;
    } while (j0);
  }

  // column j is assigned to row p[j]
  // for (int j = 1; j <= m; ++ j) ans[p[j]] = j;
  return -v[0];
}
```

6.4. Partial linear equation solver $\mathcal{O}(N^3)$.

```
typedef double NUM;
const int MAXROWS = 200, MAXCOLS = 200;
const NUM EPS = 1e-5;

// F2: bitset<MAXCOLS+1> mat[MAXROWS]; bitset<MAXROWS> vals;
NUM mat[MAXROWS][MAXCOLS + 1], vals[MAXCOLS]; bool
↪  hasval[MAXCOLS];
bool is0(NUM a) { return -EPS < a && a < EPS; }

// finds x such that Ax = b
// A_ij is mat[i][j], b_i is mat[i][m]
int solvemat(int n, int m) {
  // F2: vals.reset();
  int pr = 0, pc = 0;
  while (pc < m) {
    int r = pr, c;
    while (r < n && is0(mat[r][pc])) r++;
    if (r == n) { pc++; continue; }

    // F2: mat[pr] ^= mat[r]; mat[r] ^= mat[pr]; mat[pr] ^=
    ↪  mat[r];
    for (c = 0; c <= m; c++) swap(mat[pr][c], mat[r][c]);

    r = pr++; c = pc++;
    // F2: vals.set(pc, mat[pr][m]);
    NUM div = mat[r][c];
    for (int col = c; col <= m; col++) mat[r][col] /= div;
    for (int row = 0; row < n; row++) {
      if (row == r) continue;
      // F2: if (mat[row].test(c)) mat[row] ^= mat[r];
      NUM times = -mat[row][c];
      for (int col = c; col <= m; col++) mat[row][col] +=
      ↪  times * mat[r][col];
    }
  } // now mat is in RREF

  for (int r = pr; r < n; r++)
    if (!is0(mat[r][n])) return 0;
  // F2: return 1;
  fill_n(hasval, n, false);
  for (int col = 0, row; col < m; col++) {
    hasval[col] = !is0(mat[row][col]);
    if (!hasval[col]) continue;
    for (int c = col + 1; c < m; c++) {
      if (!is0(mat[row][c])) hasval[col] = false;
    }
    if (hasval[col]) vals[col] = mat[row][n];
    row++;
  }

  for (int i = 0; i < n; i++)
    if (!hasval[i]) return 2;
  return 1;
}
```

6.5. Cycle-Finding.

```
ii find_cycle(int x0, int (*f)(int)) {
  int t = f(x0), h = f(t), mu = 0, lam = 1;
  while (t != h) t = f(t), h = f(f(h));
  h = x0;
  while (t != h) t = f(t), h = f(h), mu++;
  h = f(t);
  while (t != h) h = f(h), lam++;
  return ii(mu, lam); }
// vim: cc=60 ts=2 sts=2 sw=2:
```

6.6. Longest Increasing Subsequence.

```
vi lis(vi arr) {
  vi seq, back(size(arr)), ans;
  rep(i,0,size(arr)) {
    int res = 0, lo = 1, hi = size(seq);
    while (lo <= hi) {

$\sum_{i=1}^{n} \binom{n}{i} F_i = F_{2n}$	$\sum_i \binom{n-i}{i} = F_{n+1}$
$\sum_{k=0}^{n} \binom{k}{m} = \binom{n+1}{m+1}$	$x^k = \sum_{i=0}^{k} i!\genfrac\{\}{0pt}{}{k}{i}\binom{x}{i} = \sum_{i=0}^{k} \left\langle{k \atop i}\right\rangle \binom{x+i}{k}$
$a \equiv b \pmod{x, y} \Rightarrow a \equiv b \pmod{\mathrm{lcm}(x, y)}$	$\sum_{d\mid n} \phi(d) = n$
$ac \equiv bc \pmod{m} \Rightarrow a \equiv b \pmod{\frac{m}{\gcd(c,m)}}$	$(\sum_{d\mid n} \sigma_0(d))^2 = \sum_{d\mid n} \sigma_0(d)^3$
p prime $\Leftrightarrow (p-1)! \equiv -1 \pmod{p}$	$\gcd(n^a - 1, n^b - 1) = n^{\gcd(a,b)} - 1$
$\sigma_x(n) = \prod_{i=0}^{r} \frac{p_i^{(a_i+1)x} - 1}{p_i^x - 1}$	$\sigma_0(n) = \prod_{i=0}^{r}(a_i + 1)$
$\sum_{k=0}^{m}(-1)^k\binom{n}{k} = (-1)^m\binom{n-1}{m}$	
$2^{\omega(n)} = O(\sqrt{n})$	$\sum_{i=1}^{n} 2^{\omega(i)} = O(n \log n)$
$d = v_i t + \frac{1}{2}at^2$	$v_f^2 = v_i^2 + 2ad$
$v_f = v_i + at$	$d = \frac{v_i + v_f}{2}t$

8.1. **The Twelvefold Way.** Putting n balls into k boxes.

Balls Boxes	same same	distinct same	same distinct	distinct distinct	 Remarks
-	$\mathrm{p}_k(n)$	$\sum_{i=0}^{k} \genfrac\{\}{0pt}{}{n}{i}$	$\binom{n+k-1}{k-1}$	k^n	$\mathrm{p}_k(n)$: #partitions of n into $\le k$ positive parts
size ≥ 1	$\mathrm{p}(n, k)$	$\genfrac\{\}{0pt}{}{n}{k}$	$\binom{n-1}{k-1}$	$k!\genfrac\{\}{0pt}{}{n}{k}$	$\mathrm{p}(n, k)$: #partitions of n into k positive parts
size ≤ 1	$[n \le k]$	$[n \le k]$	$\binom{k}{n}$	$n!\binom{k}{n}$	$[cond]$: 1 if $cond = true$, else 0

9. Useful Information

10. Misc

10.1. Debugging Tips.

- Stack overflow? Recursive DFS on tree that is actually a long path?
- Floating-point numbers
  - Getting `NaN`? Make sure `acos` etc. are not getting values out of their range (perhaps `1+eps`).
  - Rounding negative numbers?
  - Outputting in scientific notation?
- Wrong Answer?
  - Read the problem statement again!
  - Are multiple test cases being handled correctly? Try repeating the same test case many times.
  - Integer overflow?
  - Think very carefully about boundaries of all input parameters
  - Try out possible edge cases:
    - $n = 0, n = -1, n = 1, n = 2^{31} - 1$ or $n = -2^{31}$
    - List is empty, or contains a single element
    - n is even, n is odd
    - Graph is empty, or contains a single vertex
    - Graph is a multigraph (loops or multiple edges)
    - Polygon is concave or non-simple
  - Is initial condition wrong for small cases?
  - Are you sure the algorithm is correct?
  - Explain your solution to someone.
  - Are you using any functions that you don't completely understand? Maybe STL functions?
  - Maybe you (or someone else) should rewrite the solution?
  - Can the input line be empty?
- Run-Time Error?
  - Is it actually Memory Limit Exceeded?

10.2. Solution Ideas.

- Dynamic Programming
  - Parsing CFGs: CYK Algorithm
  - Drop a parameter, recover from others
  - Swap answer and a parameter
  - When grouping: try splitting in two
  - 2^k trick
  - When optimizing
    - Convex hull optimization
      - $\mathrm{dp}[i] = \min_{j<i}\{\mathrm{dp}[j] + b[j] \times a[i]\}$
      - $b[j] \geq b[j+1]$
      - optionally $a[i] \leq a[i+1]$
      - $O(n^2)$ to $O(n)$
    - Divide and conquer optimization
      - $\mathrm{dp}[i][j] = \min_{k<j}\{\mathrm{dp}[i-1][k] + C[k][j]\}$
      - $A[i][j] \leq A[i][j+1]$
      - $O(kn^2)$ to $O(kn \log n)$
      - sufficient: $C[a][c] + C[b][d] \leq C[a][d] + C[b][c]$, $a \leq b \leq c \leq d$ (QI)
    - Knuth optimization
      - $\mathrm{dp}[i][j] = \min_{i<k<j}\{\mathrm{dp}[i][k] + \mathrm{dp}[k][j] + C[i][j]\}$
      - $A[i][j-1] \leq A[i][j] \leq A[i+1][j]$
      - $O(n^3)$ to $O(n^2)$
      - sufficient: QI and $C[b][c] \leq C[a][d]$, $a \leq b \leq c \leq d$
- Greedy

- Segment trees
  - Lazy propagation
  - Persistent
  - Implicit
  - Segment tree of X
- Geometry
  - Minkowski sum (of convex sets)
  - Rotating calipers
  - Sweep line (horizontally or vertically?)
  - Sweep angle
  - Convex hull
- Fix a parameter (possibly the answer).
- Are there few distinct values?
- Binary search
- Sliding Window (+ Monotonic Queue)
- Computing a Convolution? Fast Fourier Transform
- Computing a 2D Convolution? FFT on each row, and then on each column
- Exact Cover (+ Algorithm X)
- Cycle-Finding
- What is the smallest set of values that identify the solution? The cycle structure of the permutation? The powers of primes in the factorization?
- Look at the complement problem

  - Minimize something instead of maximizing
- Immediately enforce necessary conditions. (All values greater than 0? Initialize them all to 1)
- Add large constant to negative numbers to make them positive
- Counting/Bucket sort

11. Formulas

- **Legendre symbol:** $\left(\frac{a}{b}\right) = a^{(b-1)/2} \pmod{b}$, b odd prime.
- **Heron's formula:** A triangle with side lengths a, b, c has area $\sqrt{s(s-a)(s-b)(s-c)}$ where $s = \frac{a+b+c}{2}$.
- **Pick's theorem:** A polygon on an integer grid strictly containing i lattice points and having b lattice points on the boundary has area $i + \frac{b}{2} - 1$. (Nothing similar in higher dimensions)
- **Euler's totient:** The number of integers less than n that are coprime to n are $n\prod_{p|n}\left(1-\frac{1}{p}\right)$ where each p is a distinct prime factor of n.
- **König's theorem:** In any bipartite graph $G = (L \cup R, E)$, the number of edges in a maximum matching is equal to the number of vertices in a minimum vertex cover. Let U be the set of unmatched vertices in L, and Z be the set of vertices that are either in U or are connected to U by an alternating path. Then $K = (L \setminus Z) \cup (R \cap Z)$ is the minimum vertex cover.
- A minumum Steiner tree for n vertices requires at most $n-2$ additional Steiner vertices.
- The number of vertices of a graph is equal to its minimum vertex cover number plus the size of a maximum independent set.
- **Lagrange polynomial** through points $(x_0, y_0), \ldots, (x_k, y_k)$ is $L(x) = \sum_{j=0}^{k} y_j \prod_{\substack{0 \le m \le k \\ m \ne j}} \frac{x - x_m}{x_j - x_m}$
- **Hook length formula:** If λ is a Young diagram and $h_\lambda(i,j)$ is the hook-length of cell (i,j), then then the number of Young tableux $d_\lambda = n!/\prod h_\lambda(i,j)$.
- **Möbius inversion formula:** If $f(n) = \sum_{d|n} g(d)$, then $g(n) = \sum_{d|n} \mu(d) f(n/d)$. If $f(n) = \sum_{m=1}^{n} g(\lfloor n/m \rfloor)$, then $g(n) = \sum_{m=1}^{n} \mu(m) f(\lfloor \frac{n}{m} \rfloor)$.
- #primitive pythagorean triples with hypotenuse $< n$ approx $n/(2\pi)$.
- **Frobenius Number:** largest number which can't be expressed as a linear combination of numbers $a_1, \ldots, a_n$ with non-negative coefficients. $g(a_1, a_2) = a_1a_2 - a_1 - a_2$, $N(a_1, a_2) = (a_1-1)(a_2-1)/2$. $g(d \cdot a_1, d \cdot a_2, a_3) = d \cdot g(a_1, a_2, a_3) + a_3(d-1)$. An integer $x > (\max_i a_i)^2$ can be expressed in such a way iff. $x \mid \gcd(a_1, \ldots, a_n)$.

11.1. Physics.

- **Snell's law:** $\frac{\sin\theta_1}{v_1} = \frac{\sin\theta_2}{v_2}$

11.2. Markov Chains.

A Markov Chain can be represented as a weighted directed graph of states, where the weight of an edge represents the probability of transitioning over that edge in one timestep. Let $P^{(m)} = (p_{ij}^{(m)})$ be the probability matrix of transitioning from state i to state j in m timesteps, and note that $P^{(1)}$ is the adjacency matrix of the graph. **Chapman-Kolmogorov:** $p_{ij}^{(m+n)} = \sum_k p_{ik}^{(m)} p_{kj}^{(n)}$. It follows that $P^{(m+n)} = P^{(m)}P^{(n)}$ and $P^{(m)} = P^m$. If $p^{(0)}$ is the initial probability distribution (a vector), then $p^{(0)}P^{(m)}$ is the probability distribution after m timesteps.

The return times of a state i is $R_i = \{m \mid p_{ii}^{(m)} > 0\}$, and i is *aperiodic* if $\gcd(R_i) = 1$. A MC is aperiodic if any of its vertices is aperiodic. A MC is *irreducible* if the corresponding graph is strongly connected.

A distribution π is stationary if $\pi P = \pi$. If MC is irreducible then $\pi_i = 1/\mathbb{E}[T_i]$, where T_i is the expected time between two visits at i. π_j/π_i is the expected number of visits at j in between two consecutive visits at i. A MC is *ergodic* if $\lim_{m\to\infty} p^{(0)}P^m = \pi$. A MC is ergodic iff. it is irreducible and aperiodic.

A MC for a random walk in an undirected weighted graph (unweighted graph can be made weighted by adding 1-weights) has $p_{uv} = w_{uv}/\sum_x w_{ux}$. If the graph is connected, then $\pi_u = \sum_x w_{ux}/\sum_v \sum_x w_{vx}$. Such a random walk is aperiodic iff. the graph is not bipartite.

An *absorbing* MC is of the form $P = \begin{pmatrix} Q & R \\ 0 & I_r \end{pmatrix}$. Let $N = \sum_{m=0}^{\infty} Q^m = (I_t - Q)^{-1}$. Then, if starting in state i, the expected number of steps till absorption is the i-th entry in $N1$. If starting in state i, the probability of being absorbed in state j is the (i,j)-th entry of NR.

Many problems on MC can be formulated in terms of a system of recurrence relations, and then solved using Gaussian elimination.

11.3. Burnside's Lemma.

Let G be a finite group that acts on a set X. For each g in G let X^g denote the set of elements in X that are fixed by g. Then the number of orbits

$$|X/G| = \frac{1}{|G|}\sum_{g\in G} |X^g|$$

$$Z(S_n) = \frac{1}{n}\sum_{l=1}^{n} a_l Z(S_{n-l})$$

11.4. Bézout's identity.

If (x, y) is any solution to $ax + by = d$ (e.g. found by the Extended Euclidean Algorithm), then all solutions are given by

$$\left(x + k\frac{b}{\gcd(a,b)}, y - k\frac{a}{\gcd(a,b)}\right)$$

11.5. Misc.

11.5.1. *Binomial transform.* If $a_n = \sum_{k=0}^{n} \binom{n}{k} b_k$, then $b_n = \sum_{k=0}^{n} (-1)^{n-k}\binom{n}{k} a_k$.

11.5.2. *Generating functions.* Ordinary (o.g.f.): $A(x) := \sum_{n=0}^{\infty} a_i x^i$.
Exponential (e.g.f.): $A(x) := \sum_{n=0}^{\infty} a_i x^i/i!$.
o.g.f. convolution: $c_n = \sum_{k=0}^{n} a_k b_{n-k}$ (use FFT for $\mathcal{O}(n\log n)$).
e.g.f. convolution: $c_n = \sum_{k=0}^{n} \binom{n}{k} a_k b_{n-k} = n! \sum_{k=0}^{n} \frac{a_k}{k!}\frac{b_{n-k}}{(n-k)!}$ (use FFT for $\mathcal{O}(n\log n)$).

11.5.3. *General linear recurrences.* If $a_n = \sum_{k=0}^{n-1} a_k b_{n-k}$, then $A(x) = \frac{a_0}{1-B(x)}$. We also can compute all a_n with Divide-and-Conquer algorithm in $\mathcal{O}(n \log^2 nn)$.

11.5.4. *Inverse polynomial modulo x^l.* Given $A(x)$, find $B(x)$ such that $A(x)B(x) = 1 + x^l Q(x)$ for some $Q(x)$.
Step 1: Start with $B_0(x) = 1/a_0$
Step 2: $B_{k+1}(x) = (-B_k(x)^2 A(x) + 2B_k(x)) \mod x^{2^{k+1}}$.

11.5.5. *Fast subset convolution.* Given array a_i of size 2^k calculate $b_i = \sum_{j\&i=i} a_j$.

```
for (int b = 1; b < (1 << k); b <<= 1)
  for (int i = 0; i < (1<<k); i++)
    if (!(i & b)) a[i | b] += a[i];
// inv: if (!(i & b)) a[i | b] -= a[i];
```

11.5.6. *Determinants and PM.*

$$det(A) = \sum_{\sigma\in S_n} \operatorname{sgn}(\sigma)\prod_{i=1}^{n} a_{i,\sigma(i)}$$

$$perm(A) = \sum_{\sigma\in S_n}\prod_{i=1}^{n} a_{i,\sigma(i)}$$

$$pf(A) = \frac{1}{2^n n!}\sum_{\sigma\in S_{2n}} \operatorname{sgn}(\sigma)\prod_{i=1}^{n} a_{\sigma(2i-1),\sigma(2i)} = \sum_{M\in \mathrm{PM}(n)} \operatorname{sgn}(M)\prod_{(i,j)\in M} a_{i,j}$$

11.5.7. *BEST Theorem.* Count directed Eulerian cycles. Number of OST given by Kirchoff's Theorem (remove r/c with root) $\#\mathrm{OST}(G, r) \cdot \prod_v (d_v - 1)!$

11.5.8. *Primitive Roots.* Only exists when n is $2, 4, p^k, 2p^k$, where p odd prime. Assume n prime. Number of primitive roots $\phi(\phi(n))$ Let g be primitive root. All primitive roots are of the form g^k where $k, \phi(p)$ are coprime.
k-roots: $g^{i\cdot\phi(n)/k}$ for $0 \le i < k$

11.5.9. *Sum of primes.* For any multiplicative f:

$$S(n,p) = S(n,p-1) - f(p)\cdot(S(n/p, p-1) - S(p-1, p-1))$$

11.5.10. *Floor.*

$$\lfloor \lfloor x/y \rfloor / z \rfloor = \lfloor x/(yz) \rfloor$$

$$x\%y = x - y\lfloor x/y \rfloor$$

Practice Contest Checklist

- How many operations per second? Compare to local machine.
- What is the stack size?
- How to use printf/scanf with long long/long double?
- Are `__int128` and `__float128` available?
- Does MLE give RTE or MLE as a verdict? What about stack overflow?
- What is `RAND_MAX`?
- How does the judge handle extra spaces (or missing newlines) in the output?
- Look at documentation for programming languages.
- Try different programming languages: C++, Java and Python.
- Try the submit script.
- Try local programs: i?python[23], factor.
- Try submitting with `assert(false)` and `assert(true)`.
- Return-value from `main`.
- Look for directory with sample test cases.
- Make sure printing works.
- Remove this page from the notebook (optionally).
