#### 0.1. De winnende aanpak.

- Goed slapen & een vroeg ritme hebben
- Genoeg drinken & eten voor en tijdens de wedstrijd
- Een lijst van alle problemen met info waar het over gaat, en wie het goed kan oplossen
- Ludo moet ALLE opgaves goed lezen
- Test de kleine voorbeeldgevallen
- Houd na 2 uur een pauze en overleg waar iedereen mee bezig is
- Maak zelf wat test-cases
- Typ de dingen uit de TCR, die je zeker nodig hebt, alvast in
- Als iemand niks te doen heeft, kan hij nodige dingen uit de TCR typen.

- We moeten ook een voorbeeld test-case voor TCR algoritmes hebben om te testen of het goed overgetypt is
- Bij geometrie moeten we om kunnen gaan met meerdere input manieren (voor bv. lijnen)
- Gebruik veel long long's

### 0.2. Wrong Answer.

- (1) Print de oplossing om te debuggen! Kijk ook naar andere (mogelijk makkelijkere) problemen.
- Bedenk zelf test-cases met randgevallen!
- (2) Bedenk zelf test-cases met randgevauen:
   (3) Controleer op overflow (gebruik OVERAL long long, long dou-
  - Kijk naar overflows in tussenantwoorden bij modulo.
- Controleer de **precisie**.
- Controleer op **typo's**.
- Loop de voorbeeldinput accuraat langs. Controller op off-by-one-errors (in indices of lus-grenzen)?
- 0.3. **Detecting overflow.** These are GNU builtins, detect both overand underflow. Returns a boolean upon failure, otherwise the result is present in ref. Follow the template:

```
1 bool isOverflown = __builtin_[add|mul|sub]_overflow(a, b, \&
```

#### 0.4. Covering problems.

 $Minimum\ edge\ cover \iff Maximum\ independent\ set$ 

- Matching: A set of edges without common vertices (Maximum is the largest such set, maximal is a set which you cannot add more edges to without breaking the property).
- Minimum Vertex Cover: A set vertices (cover) such that each edge in the graph is incident to at least one vertex of the set.
- Minimum Edge Cover: A set of edges (cover) such that every vertex is incident to at least one edge of the set.
- Maximum Independent Set: A set of vertices in a graph such that no two of them are adjacent.
- König's theorem: In any bipartite graph, the number of edges in a maximum matching equals the number of vertices in a minimum vertex cover
- 0.5. Game theory. A game can be reduced to Nim if it is a finite impartial game. Nim and its variants include:
- Nim: Let  $X = \bigoplus_{i=1}^n x_i$ , then  $(x_i)_{i=1}^n$  is a winning position iff  $X \neq 0$ . Find a move by picking k such that  $x_k > x_k \oplus X$ .
- Misère Nim: Regular Nim, except that the last player to move loses. Play regular Nim until there is only one pile of size larger than 1, reduce it to 0 or 1 such that there is an odd number of piles.
- Staricase Nim: Stones are moved down a staircase and only removed from the last pile.  $(x_i)_{i=1}^n$  is an L-position if  $(x_{2i-1})_{i=1}^{n/2}$  is (i.e. only look at odd-numbered piles).
- **Moore's Nim**<sub>k</sub>: The player may remove from at most k piles (Nim =Nim<sub>1</sub>). Expand the piles in base 2, do a carry-less addition in base k+1 (i.e. the number of ones in each column should be divisible by k+1).
- **Dim**<sup>+</sup>: The number of removed stones must be a divisor of the pile size. The Sprague-Grundy function is k+1 where  $2^k$  is the largest power of 2 dividing the pile size.
- Aliquot game: Same as above, except the divisor should be proper (hence 1 is also a terminal state, but watch out for size 0 piles). Now the Sprague-Grundy function is just k.

Write  $n+1=2^m y$  with m maximal, then the 49 return pll (mod (s \* b \* n + t \* a \* m, nm) / d, nm / d); 14 void update (int i, S v) { git diff solution

Sprague-Grundy function of n is (y-1)/2.

Lasker's Nim: Players may alternatively split a pile into two new <sup>51</sup>

**Lasker's Nim:** Players may alternatively split a pile into two new non-empty piles. g(4k+1) = 4k+1, g(4k+2) = 4k+2, g(4k+3) = 4k+4, g(4k+4) = 4k+3  $(k \ge 0)$ .

**Hackenbush on trees:** A tree with stalks  $(x_i)_{i=1}^n$  may be replaced with a single stalk with length  $\bigoplus_{i=1}^n x_i$ .

A useful identity:  $\bigoplus_{x=0}^{a-1} x = \{0, a-1, 1, a\} [a \mod 4].$ 

1 int abs(int x) { return x > 0 ? x : -x; }
