```

### 0.1. De winnende aanpak.

- Goed slapen & een vroeg ritme hebben
- Genoeg drinken & eten voor en tijdens de wedstrijd
- Een lijst van alle problemen met info waar het over gaat, en wie het goed kan oplossen f ALLE opgaves f goed lezen
- Test de kleine voorbeeldgevallen
- Houd na 2 uur een pauze en overleg waar iedereen mee bezig is
- Maak zelf wat test-cases
- Typ de dingen uit de TCR, die je zeker nodig hebt, alvast in
- Als iemand niks te doen heeft, kan hij nodige dingen uit de TCR
- We moeten ook een voorbeeld test-case voor TCR algoritmes hebben om te testen of het goed overgetypt is
- Bij geometrie moeten we om kunnen gaan met meerdere input manieren (voor by. lijnen)
- Gebruik veel long long's

### 0.2. Wrong Answer.

- (1) Print de oplossing om te debuggen! Kijk ook naar andere (mogelijk makkelijkere) problemen.
- Bedenk zelf test-cases met randgevallen!
- Controleer op **overflow** (gebruik **OVERAL** long long, long dou-

Kijk naar overflows in tussenantwoorden bij modulo.

- Controleer de **precisie**.
- Controleer op typo's.
  Loop de voorbeeldinput accuraat langs.
- Controller op off-by-one-errors (in indices of lus-grenzen)?
- 0.3. **Detecting overflow.** These are GNU builtins, detect both overand underflow. Returns a boolean upon failure, otherwise the result is present in ref. Follow the template:

```
1 bool isOverflown = __builtin_[add|mul|sub]_overflow(a, b, \&res);
```

### 0.4. Covering problems.

 $Minimum\ edge\ cover \iff Maximum\ independent\ set$ 

Matching: A set of edges without common vertices (Maximum is the largest such set, maximal is a set which you cannot add more edges to without breaking the property).

Minimum Vertex Cover: A set vertices (cover) such that each edge in the graph is incident to at least one vertex of the set.

Minimum Edge Cover: A set of edges (cover) such that every vertex is incident to at least one edge of the set.

Maximum Independent Set: A set of vertices in a graph such that no two of them are adjacent.

ll r = 1;

```
König's theorem: In any bipartite graph, the number of edges in22
                                                                         while (b) {
                                                                                                                                             bool millerRabin(ll n){
                                                                           if (b & 1) r = (r * a) % m: // r = mulmod(r, a, m):
        maximum matching equals the number of vertices in a minimum

### 8. Useful Information

### 9. Misc

### 9.1. Debugging Tips.

- Stack overflow? Recursive DFS on tree that is actually a long path?
- Floating-point numbers
  - Getting NaN? Make sure acos etc. are not getting values out of their range (perhaps 1+eps).
  - Rounding negative numbers?
  - Outputting in scientific notation?
- Wrong Answer?
  - Read the problem statement again!
  - Are multiple test cases being handled correctly? Try repeating the same test case many times.
  - Integer overflow?
  - Think very carefully about boundaries of all input parameters
  - Try out possible edge cases:
    - \*  $n = 0, n = -1, n = 1, n = 2^{31} 1$  or  $n = -2^{31}$
    - \* List is empty, or contains a single element
    - \* n is even, n is odd
    - \* Graph is empty, or contains a single vertex
    - \* Graph is a multigraph (loops or multiple edges)
    - \* Polygon is concave or non-simple
  - Is initial condition wrong for small cases?
  - Are you sure the algorithm is correct?
  - Explain your solution to someone.
  - Are you using any functions that you don't completely understand? Maybe STL functions?
  - Maybe you (or someone else) should rewrite the solution?
  - Can the input line be empty?
- Run-Time Error?
  - Is it actually Memory Limit Exceeded?

#### 9.2. Solution Ideas.

- Dynamic Programming
  - Parsing CFGs: CYK Algorithm
  - Drop a parameter, recover from others
  - Swap answer and a parameter
  - When grouping: try splitting in two
  - $-2^k$  trick
  - When optimizing
    - \* Convex hull optimization
      - $\cdot \operatorname{dp}[i] = \min_{j < i} \{\operatorname{dp}[j] + b[j] \times a[i]\}$
      - b[j] > b[j+1]
      - optionally  $a[i] \leq a[i+1]$
      - ·  $O(n^2)$  to O(n)
    - \* Divide and conquer optimization
      - $dp[i][j] = \min_{k < i} \{dp[i-1][k] + C[k][j]\}$
      - $A[i][j] \le A[i][j+1]$
      - ·  $O(kn^2)$  to  $O(kn\log n)$
      - · sufficient:  $C[a][c] + C[b][d] \le C[a][d] + C[b][c]$ ,  $a \le b \le c \le d$  (QI)
    - \* Knuth optimization
      - $dp[i][j] = \min_{i < k < j} \{dp[i][k] + dp[k][j] + C[i][j]\}$
      - $A[i][j-1] \le A[i][j] \le A[i+1][j]$
      - $O(n^3)$  to  $O(n^2)$

- · sufficient: QI and  $C[b][c] \leq C[a][d], a \leq b \leq c \leq d$
- Greedy
- Randomized
- Optimizations
  - Use bitset (/64)
  - Switch order of loops (cache locality)
- Process queries offline

- Computing a Convolution? Fast Fourier Transform
- Computing a 2D Convolution? FFT on each row, and then on each
- Exact Cover (+ Algorithm X)
- Cycle-Finding

column

- What is the smallest set of values that identify the solution? The cycle structure of the permutation? The powers of primes in the factorization?
- Look at the complement problem

- Minimize something instead of maximizing
  - 0? Initialize them all to 1)
- Add large constant to negative numbers to make them positive
- Counting/Bucket sort

### 10. Formulas

- Legendre symbol:  $(\frac{a}{1}) = a^{(b-1)/2} \pmod{b}$ , b odd prime.
- Heron's formula:  $\tilde{A}$  triangle with side lengths a, b, c has area  $\sqrt{s(s-a)(s-b)(s-c)}$  where  $s=\frac{a+b+c}{2}$
- Pick's theorem: A polygon on an integer grid strictly containing i lattice points and having b lattice points on the boundary has area  $i + \frac{b}{2} - 1$ . (Nothing similar in higher dimensions)
- Euler's totient: The number of integers less than n that are coprime to n are  $n \prod_{p|n} \left(1 - \frac{1}{p}\right)$  where each p is a distinct prime factor of n.
- König's theorem: In any bipartite graph  $G = (L \cup R, E)$ , the number of edges in a maximum matching is equal to the number of vertices in a minimum vertex cover. Let U be the set of unmatched vertices in L, and Z be the set of vertices that are either in U or are connected to Uby an alternating path. Then  $K = (L \setminus Z) \cup (R \cap Z)$  is the minimum vertex cover.
- A minumum Steiner tree for n vertices requires at most n-2 additional Steiner vertices.
- The number of vertices of a graph is equal to its minimum vertex cover number plus the size of a maximum independent set.
- Lagrange polynomial through points  $(x_0, y_0), \ldots, (x_k, y_k)$  is L(x) = $\sum_{j=0}^{k} y_j \prod_{\substack{0 \le m \le k \\ m \ne j}} \frac{x - x_m}{x_j - x_m}$
- Hook length formula: If  $\lambda$  is a Young diagram and  $h_{\lambda}(i,j)$  is the hook-length of cell (i, j), then then the number of Young tableux  $d_{\lambda} = n! / \prod h_{\lambda}(i, j).$
- Möbius inversion formula: If  $f(n) = \sum_{d|n} g(d)$ , then  $g(n) = \sum_{d|n} g(d)$  $\sum_{d|n} \mu(d) f(n/d). \quad \text{If } f(n) = \sum_{m=1}^{n} g(\lfloor n/m \rfloor), \text{ then } g(n)$  $\sum_{m=1}^{n} \mu(m) f(\lfloor \frac{n}{m} \rfloor).$
- #primitive pythagorean triples with hypotenuse  $\langle n \text{ approx } n/(2\pi).$
- Frobenius Number: largest number which can't be expressed as a linear combination of numbers  $a_1, \ldots, a_n$  with non-negative coefficients.  $g(a_1, a_2) = a_1 a_2 - a_1 - a_2$ ,  $N(a_1, a_2) = (a_1 - 1)(a_2 - 1)/2$ .  $q(d \cdot a_1, d \cdot a_2, a_3) = d \cdot q(a_1, a_2, a_3) + a_3(d-1)$ . An integer  $x > (\max_i a_i)^2$ can be expressed in such a way iff.  $x \mid \gcd(a_1, \ldots, a_n)$

#### 10.1. Physics.

- Snell's law:  $\frac{\sin \theta_1}{v_1} = \frac{\sin \theta_2}{v_2}$
- 10.2. Markov Chains. A Markov Chain can be represented as a weighted directed graph of states, where the weight of an edge represents the probability of transitioning over that edge in one timestep. Let  $P^{(m)} = (p_{ij}^{(m)})$  be the probability matrix of transitioning from state i to state j in m timesteps, and note that  $P^{(1)}$  is the adjacency matrix of the graph. Chapman-Kolmogorov:  $p_{ij}^{(m+n)} = \sum_k p_{ik}^{(m)} p_{kj}^{(n)}$ . It follows that  $P^{(m+n)} = P^{(m)}P^{(n)}$  and  $P^{(m)} = P^m$ . If  $p^{(0)}$  is the initial probability distribution (a vector), then  $p^{(0)}P^{(m)}$  is the probability distribution after m timesteps.

The return times of a state i is  $R_i = \{m \mid p_{ii}^{(m)} > 0\}$ , and i is aperiodic • Immediately enforce necessary conditions. (All values greater than if  $gcd(R_i) = 1$ . A MC is aperiodic if any of its vertices is aperiodic. A MC is *irreducible* if the corresponding graph is strongly connected.

> A distribution  $\pi$  is stationary if  $\pi P = \pi$ . If MC is irreducible then  $\pi_i = 1/\mathbb{E}[T_i]$ , where  $T_i$  is the expected time between two visits at i.  $\pi_i/\pi_i$ is the expected number of visits at j in between two consecutive visits at i. A MC is ergodic if  $\lim_{m\to\infty} p^{(0)}P^m = \pi$ . A MC is ergodic iff. it is irreducible and aperiodic.

A MC for a random walk in an undirected weighted graph (unweighted graph can be made weighted by adding 1-weights) has  $p_{uv} = w_{uv} / \sum_x w_{ux}$ . If the graph is connected, then  $\pi_u =$  $\sum_{x} w_{ux} / \sum_{v} \sum_{x} w_{vx}$ . Such a random walk is aperiodic iff. the graph is not bipartite.

An absorbing MC is of the form  $P = \begin{pmatrix} Q & R \\ 0 & I_r \end{pmatrix}$ . Let N =

 $\sum_{m=0}^{\infty} Q^m = (I_t - Q)^{-1}$ . Then, if starting in state i, the expected number of steps till absorption is the i-th entry in N1. If starting in state i, the probability of being absorbed in state j is the (i, j)-th entry of NR.

Many problems on MC can be formulated in terms of a system of recurrence relations, and then solved using Gaussian elimination.

10.3. Burnside's Lemma. Let G be a finite group that acts on a set X. For each q in G let  $X^g$  denote the set of elements in X that are fixed by q. Then the number of orbits

$$|X/G| = \frac{1}{|G|} \sum_{g \in G} |X^g|$$

$$Z(S_n) = \frac{1}{n} \sum_{l=1}^{n} a_l Z(S_{n-l})$$

10.4. **Bézout's identity.** If (x,y) is any solution to ax + by = d (e.g. found by the Extended Euclidean Algorithm), then all solutions are given

$$\left(x + k \frac{b}{\gcd(a,b)}, y - k \frac{a}{\gcd(a,b)}\right)$$

10.5. Misc.

10.5.1. Determinants and PM.

$$\begin{split} \det(A) &= \sum_{\sigma \in S_n} \operatorname{sgn}(\sigma) \prod_{i=1}^n a_{i,\sigma(i)} \\ perm(A) &= \sum_{\sigma \in S_n} \prod_{i=1}^n a_{i,\sigma(i)} \\ pf(A) &= \frac{1}{2^n n!} \sum_{\sigma \in S_{2n}} \operatorname{sgn}(\sigma) \prod_{i=1}^n a_{\sigma(2i-1),\sigma(2i)} \\ &= \sum_{M \in \operatorname{PM}(n)} \operatorname{sgn}(M) \prod_{(i,j) \in M} a_{i,j} \end{split}$$

10.5.2. BEST Theorem. Count directed Eulerian cycles. Number of OST given by Kirchoff's Theorem (remove r/c with root) #OST(G,r).  $\prod_{v}(d_{v}-1)!$ 

10.5.3. Primitive Roots. Only exists when n is  $2, 4, p^k, 2p^k$ , where p odd prime. Assume n prime. Number of primitive roots  $\phi(\phi(n))$  Let q be primitive root. All primitive roots are of the form  $q^k$  where  $k, \phi(p)$  are

k-roots:  $q^{i \cdot \phi(n)/k}$  for  $0 \le i \le k$ 

10.5.4. Sum of primes. For any multiplicative f:

$$S(n,p) = S(n,p-1) - f(p) \cdot (S(n/p,p-1) - S(p-1,p-1))$$

10.5.5. Floor.

$$\lfloor \lfloor x/y \rfloor / z \rfloor = \lfloor x/(yz) \rfloor$$
$$x\%y = x - y |x/y|$$

## PRACTICE CONTEST CHECKLIST

- How many operations per second? Compare to local machine.
- What is the stack size?
- How to use printf/scanf with long long/long double?
- Are \_\_int128 and \_\_float128 available?
- Does MLE give RTE or MLE as a verdict? What about stack overflow?
- What is RAND\_MAX?
- How does the judge handle extra spaces (or missing newlines) in the output?
- Look at documentation for programming languages.
- Try different programming languages: C++, Java and Python.
- Try the submit script.
- Try local programs: i?python[23], factor.
- Try submitting with assert(false) and assert(true).
- Return-value from main.
- Look for directory with sample test cases.
- Make sure printing works.
- Remove this page from the notebook.
